Trees American Forest

By Henry H. Gibson

Edited by Hu Maxwell

"AMERICAN FOREST TREES" is a comprehensive work of more than seven hundred pages, illustrated by more than one hundred full page pictures of forest types of tree growth, and hundreds of minor pictures.

It answers every question worth asking about the infinite variety of forest growth in this country, and the utilization of these woods in lumber and other forms. The opinion of an

expert on this work is:

"AMERICAN FOREST TREES" is the foremost contribution that has ever been made to American forest and lumber literature.

The price of this work is Six Dollars (\$6.00) net. It will be sent on receipt of price, prepaid, subject to return and refund of payment if it does not prove satisfactory,

The very complete character of this work may be judged by the index following:

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.

VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Qua

snape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut
quartered oak. Our quartered oak panels are all from sawed
weneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

Custom Mill Work, Storage, Inspection

ON

Foreign Fancy Woods, Mahogany, Cedar, Circassian

We receive the logs, store or warehouse them, manufacture them into lumber, cut or saw veneers, pile and store the product, and ship via any railroad. Also furnish inspection returns on logs or lumber. Can furnish accommodations and economies which it is impossible to secure elsewhere. We always have on our yards parcels of plain and figured African, Mexican and Cuban Mahogany, Circassian Walnut and Cedar logs, placed here for sale by direct foreign shippers, from which advantageous purchases can be made.

A Fine Opportunity to Dispose of Narrow, Short and Low Grade Oak

To the oak lumber manufacturer who accumulates considerable oak lumber that can not be sold unless they put a price on it that is so low that there's no money in it, there is now offered a fine opportunity to dis-

pose of this lumber by making it up into oak flooring squares like the illustration.

These squares are jointed together without glue on the

Linderman Automatic Jointer Gluer, Clamper and Sizer

squared to the exact width. A straight tongue and groove is then cut on the two sides and ends.

The demand for these flooring squares is greatly in excess of the present output. Still there are several Southern manufacturers making these flooring squares.

One New York firm wants a good many car loads of the Linderman Flooring Squares. The prices it offers will net you, delivered New York City, practically as much as you are getting from the better grade of oak lumber.

Write today for further information and we will give you the details of the market, manufacturing costs, etc. You're not obligated in any way in asking for particulars, yet it might be of value and worth your consideration.

An Appropriate Gift

What could be more acceptable as a Christmas or New Year's gift to your friend in the lumber or veneer business, or in any line connected with forest products, than a copy of "AMERICAN FOREST TREES"? This beautifully illustrated and bound volume contains, as you know, every bit of practical information worth knowing regarding American forest trees. In addition it is absolutely above criticism in the matter of technical correctness; in short, an absolutely authoritative publication written in the practical man's language.

In order to insure the volume being delivered on time, write immediately to HARD-WOOD RECORD, 537 South Dearborn Street, Chicago, Ill., enclosing remittance, Price \$6.00, prepaid.

CITY,

Why We Can Give "Value Received"

We own one hundred thousand acres of the best virgin Southern Hardwood timber.

We operate large band mills at Huttig, Ark., and Deering, Mo.

We cut FORTY MILLION feet of hardwoods annually and carry 15,000,000 feet IN STOCK.

We sell only stock cut on our own mills and so can GUAR-ANTEE the quality of EVERY shipment.

We ship high grades that increase the size and percentage of your cuttings, reduce factory costs and shrink the waste pile. Therefore:

We can SAVE YOU MONEY on every shipment of oak, ash, gum, elm, cypress, tupelo, hickory, cottonwood, sycamore, soft maple and dimension.

Do You Buy in Mixed Cars?

I be you prefer to buy cars containing a number of items of lumber, instead of buying carload lots of each item, you will find that business of this kind can be handled to the best advantage in Louisville.

The reason for this is first, that **Louisville** regularly handles a greater number of hardwoods than any other market of consequence, and second, that the stocks of the leading houses are interchangeable, enabling co-operative arrangements to be made in filling a car calling for scarce or unusual items.

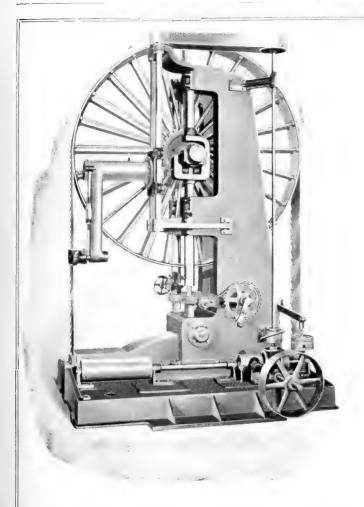

If you want a few thousand feet of some item which you have had a hard time getting, let one of the undersigned ship it to you in a car of a staple commodity. The stock you want is here, all right; it is simply a question of letting us know that you want it.

Incidentally, remember that 1914 is going to be a good year, and that hardwood lumber is pretty sure to be worth a good deal more in a few months than it is now. The bankers say that the new currency bill will make for easy money, and if you want to make some easy money on hardwoods, either for your own use or for resale, don't forget to write to Louisville, Headquarters for Hardwoods.

Newest Hoosier Band Saw Mill

We have been building band mills for thirtyfive years and this New Hoosier Band Saw Mill represents the experience of these years.

The simplest mill in construction and the easiest kept in order.

We build this mill in three sizes, 6, 7 and 8 ft. The widest saw the 6 ft. mill will carry is 10"; the 7 and 8 ft. mills will carry 10, 11 or 12" saws. This mill is built in a substantial manner and embodies all that is latest and best in Band Mill design. The base is of the heavy extension pattern and is so constructed

that it does not overhang the foundation but extends completely around the mill. By means of the construction of the column the upper wheel runs in the center of the mill and is supported both above and below the mandrel. The bearings are long and are chain oiling.

The tension device has roller bearings and is very sensitive and durable. The upper guide is raised and lowered by power and is nonbreakable. The lower guide is so arranged that it can be opened quickly. The roll back of the saw is power driven.

The 6 ft. mill will split a 48" log and lay down a 30" board between saw and column; the 7 ft. will split a 54" log and lay down a 36" board, the 8 ft. will split a 57" log and lay down a 42" board.

Review and Outlook

General Market Conditions

THE NEW YEAR IS TOO YOUNG to have developed any real indication of what is to come during the next few months, but it can be stated most emphatically that in space of the conditions which the lunder trade has been buttling against for several months. there probably has never been more general feeling of hope or more sincere belief in the future of the lumber business. This opinion is not merely the expression of a few members of the trade but is rather the conseasus of opinion as expressed by a large number of the most representative men in the business in various sections of the country. The usual opinion is that beginning with the latter part of this month or the early weeks in February there will be real evidence of a change in the tone of general business of the country.

The two factors which have played an important part in all mar ket reports in all lines of business for the last few months-namely, the tariff and currency legislation-are of course statutes now duly the law of the land, but it is nevertheless a fact that the influence of these national questions is still being felt. Foreign manufacturers are really just beginning to feel out the possibilities of trade in this market and it will probably be some little time before they will be actively engaged in competition with domestic manufacturers and then of course arises the problem as to what the outcome of the trade war will be. It is really too early to form any definite idea regarding the direct effect of this proposed foreign invasion upon the manufacturing interests of the United States. Thus the real effect of the tariff is a matter of the future rather than of the past.

Regarding the currency matter, this too is still in the throes of formation but its probable future effect on business can be more clearly analyzed than can the effects of the tariff. It is really a question of merely working out the details of the organization, as the probable working out of the measure can be clearly seen in its theoretical form, which has been pronounced distinctly favorable.

Another encouraging feature of the general situation is the rather better tone which prevails in regard to export shipments. This is more notably true of shipments from eastern centers than from southera ports. Eastern exporters state that the note of inquiry as coming from abroad is very favorable and is the result of a really distinct shortage in all lines of hardwood stocks, which shortage must soon be filled. New Orleans and other southern exporters, however, say that while the situation promises well for the future it is not now in a definitely settled state, the uncertainty as to ocean freight rates seems to be holding up the placing of orders and getting out of shipments. However, generally speaking, it can be said that the export situation looks better than it has for some little time.

Locally, the hopes of the majority of the lumbermen are based

upon really good indications from the consuming end and on favor able conditions which exist at the producing end. The stock situation at the mills continues to be in first-class shape and conditions now existing in some of the southern producing sections promise anything but an accumulation of stocks. In the territory around Memphis, for instance, the outlook for log supply for the coming few months is not at all encouraging, in fact it is stated that along the right of way of the Yazoo & Mississippi Valley the logs piled along the tracks aggregate not more than twenty-five or fifty per cent of what was desired. It is predicted that unless entirely unusual logging weather puts in an appearance during the next couple of months, mills in the Memphis territory will not have enough logs to keep up their output. Northern manufacturers are in a position somewhat similar, as the extremely moderate weather and the absence of snow and freezing temperature has seriously retarded log hauling. Manufacturers in other points are not so retarded but, while they will have their full run, the stock which they will manufacture will all be in strong hands and there will be no danger of its tending to break the market.

No change of notable significance regarding the relative popularity of the various hardwoods has been recorded so far this year, nor is there anything that would particularly indicate a prospective change in their relative standing except regarding the upper grades of most of the more important species. A more favorable demand will necessarily have a lifting effect upon the market for the various grades of the different woods but it is quite likely that the better end of the stock will be most noticeably affected as it is this particular kind of lumber which has felt the recent depression most severely. There have not been any discouraging breaks in the market in general, nor is there anything to indicate any change other than the strengthening of prices all along the line.

Trees Old and Young

W HO KNOWS THAT DE SOTO did not tether his mule to the white oak sapling which is represented by the log on the eight-wheeled wagon in the cover picture illustrating this issue of HARDWOOD RECORD? The tree from which that log was cut was probably growing in the Mississippi forests while the Spanish explorer was searching his way westward through a country then unknown. He penetrated to the Mississippi river, crossed it, only to perish, and he was buried beneath its muddy waters, his body being enclosed in a hollow tree trunk and loaded with weights to sink it to the bottom. That was the first and the most famous coffin ever known in the Mississippi valley.

The enormous oak log shown in the picture was cut from a tree four or five hundred years old, and whether De Soto's cavalcade. some plat new horses, and bogs, passed that way or not, the age of the free s proof that it was standing at that remote time. It was recently cut by the Carrier Lomber and Manufacturing Company of Sardis, Miss.

The scene which the poets e shows so well is a hardwood forest and a be vary. No softwood is seen. The equipment for hauling and the craciacter of the tanding timber identity the place as belonging in the South. Though oak is a leading feature of the woodlands, it is only one of many trees which go to the mills in that region. The jogs on the dump furnish proof of that fact,

The size of the oak log on the wagon will attract most attention. It is unusual but not phenomenal. Some trees increase in value in proportion as they increase in size; others add to their value as they grow in both age and size; while still others are most valuable, in proportion to size, while young. Bulk, therefore, is not the only factor to consider in estimating the worth of a tree, though usually it is the most important. When figured wood is the basis of value, age is essential and size is desirable. This is illustrated by the oaks and black walnut. Colors, on which some of the figures largely depend for their attractiveness, are deepened by age. Size alone will not always do it; but handsome figure unaccompanied by good size is at a disadvantage.

Certain other trees do not increase in value with age, except as they grow in bulk. Some even deteriorate for certain uses as they age. Hickory and ash are in that class. The wood of these trees, after they have attained the size necessary to produce the stock required for vehicles, handles, and agricultural implements, does not improve as centuries are added. In recognition of that fact, manufacturers often advertise that they use second growth hickory and ash. That is, they cut their stock from small trees; for "second growth," when the term is so employed, cannot mean any thing else.

The young wood is better because it is tougher if not stronger; and for many uses it is liked better because it is whiter. That is particularly true in the manufacture of handles. Figured wood adds little or nothing to a handle's value; in fact, it may be objectionable. Buyers of woods for vehicles, implements, and handles do not search for the largest ash and hickory to be found. They may take such trees, but it is not because they prefer them.

The same rule holds fairly well for oak, and formerly was almost iron bound in its application when oak was used for wagon material. Before large factories were in existence the oldtime village wagon maker went to the forest for his wheel and axle stock. He either cut it himself or supervised the cutting and was his own inspector. He did not select the oldest and largest oaks, though such were plentiful. Those under two feet in diameter-down to a foot-suited him best. Brashness that comes with age is absent from a tree of that size. The old-fashioned wagons would look peculiar today; but they had lasting properties that would compare with anything in the vehicle line now. The wagons made at Conestoga, Pa., and at Newtown, Va., seventy-five or a hundred years ago were famous in their day; and their fame was due to the tough young oak in their wheels and axles. Every piece was split out to insure against cross grain and knots.

The appreciation of mature oak is modern. The custom of quarter-sawing made it popular. Figure and color are the chief considerations. Two or three centuries added to the standing tree give tone and class. Toughness is not essential or desirable. The opposite is wanted. The wood must work easily, if the manufacturer of furniture and finish is to use it. Figure and color are the essentials. It is thus seen that the oak is pre-eminently fitted for one class of commodities while young and for a wholly different class when old. Though the tree may stand five hundred years, there is no time after it has passed a diameter of one foot, when it is not excellent material for one or more kinds of articles.

An Interesting Résumé of Business

HE CHAMBER OF COMMERCE of the United States has gotten THE CHAMBER OF COMMERCE, or the control of our some mighty instructive literature during its short existence. One of its latest efforts is a compilation of trade analyses covering

the various sections of the country from the Atlantic to the Pacific coasts. In correction with this written resume is a chart to show graphically the areas affected and the tone of business in the different

It is interesting to note that a vast bulk of the area of the country, including the entire western section and practically all of Texas. is shown to report "fair business" conditions. A very small area is grouped under the specification "poor," and this comprises a small section immediately adjacent to New York, mainly in New Jersey, part of castern Pennsylvania, most of Kentucky, the southern part of Tennessee, southern Mississippi, western Arkansas, Missouri, most of Oklahoma, southern section of Kansas, and about onewalt or the central portions of North and South Dakota and

It is apparent that this unfavorable report emanates from the agricultural sections of the country, mainly, and in view of the cash returns from this year's crops, it is rather difficult to reconcile these conditions. It would indicate, however, that the actual cash received by the producer has not been what he had anticipated, and that the bulk of the ultimate price paid for agricultural products was realized by the links in the chain between the producer and the consumer.

Maine and New Hampshire are shown as exhibiting good business conditions throughout as are also West Virginia and Wisconsin. The greater part of Montana is also shown in this category. Other states reporting favorably are the northern part of Iowa, most of Alabama, central Pennsylvania, northern Ohio and Indiana, western Tennessee and northern Mississippi. This means that with the exception of the Montana territory, all reports of really good business come from the states east of the Mississippi and the white area shown which represents the sections reporting under this classification, really comprises quite a little of the eastern half of the United States, and offers a very substantial area in excess of the shaded portion representing poor business.

Thus it can be seen that with good reports and poor reports balancing with a slight balance in favor of the former, and with reports of fair business predominating largely, the general idea of business conditions is not discouraging at all throughout the country. It is reasonable to suppose that the information gathered by the National Chamber of Commerce is authentic. It is also probable that the information has been in the process of collation for some little time, and that since the beginning of this effort conditions have improved somewhat. Hence, there is real reason to believe that the year 1914 will be favorable to business in general.

Chicago Building Situation

R EPORTS IN CIRCULATION in Chicago territory would indicate that there is absolutely no hope for the building situation in that city, but this expression is more or less belied by observation in the various apartment sections of the city.

A casual survey of the residential districts shows there are innumerable flat buildings of all types being erected, which would indicate that there is and will continue to be a good call for building materials going into this construction. This of course is the type of building that most affects the lumberman, for while the construction of office buildings may slacken in activity, the falling off in this line is not unduly serious as the quantity of lumber there consumed as compared to the consumption in the planning of flat buildings is, comparatively speaking, not great.

Missouri Ouster Decision

 $R_{
m make}^{
m ECENT\ PROCEEDINGS}$ directly affecting the lumber trade make it evident that the suggestions of President Wilson regarding the application of the anti-trust law might well be put into effect on a nation-wide basis, and the entire matter confined strictly to federal control. It may be remembered that the President has expressed himself as favoring only action which will clarify the issues as set forth by the anti-trust law and that it is not the intention of the administration to drastically revise the provisions of that act. A recent issue of the supreme court of the state of Missouri, whereby a large number of the most important yellow pine manufacturers in

that state were fined heavily and it is nauded to remove their operations outside of the state brists, is safely evidence that some such matimal regulations of these questions would be highly beneficial. This is particularly true inasmuch as it is very problematical if the decision handed down is an entirely fair one. In fact, it seems that it is really the close application of an obsolete law as compelled by a court which seems to have been rather biased in the question.

The principal charges on which the decision was ultimately rendered seemed to be the issuance of price lists, suggestions on the part of members of the association regarding curtailment of cut, and the maintaining of information regarding the various customers of the pine association. While the ultimate ruling is very likely correct as far as legal technicalities are concerned and as far as its conformity to obsolete law is in evidence, it is certainly not a decision based on real justice. Hence, while it obeys the law it does not appear to be a measure living up to the real purpose of the law.

While the defendants were unquestionably technically guilty of the charges specified, it was prover beyond a shadow of a doubt that the motives behind their various actions were anything but motives which should rightly lead to criminal prosecution. One of the most prominent of the defendants said that in all their actions the yellow pine manufacturers had endgavored to conform closely to the requirements of the law, but that it was impossible even for expert lawyers to specify the strict legality of all actions considering the very much myolved character of present Missouri statutes regarding these matters.

It is highly probable that with some real regulations of trust and corporation conditions instituted by the federal government, justice of a more real character would be the result.

Buffalo and the National Wholesalers

GRANTING THE REASONABLENESS of the policy of shifting the convention points for the important lumber associations, the decision of the board of governors of the National Wholesale Lumber Dealers' Association to hold the next annual meeting March 5 and 6 at Buffalo, should meet with the entire approval of everyone interested in that most worthy organization and its purposes. Not only is Buffalo an entirely logical meeting place, for this association in particular, but it is a city which is amply able to take care of the hundreds of visitors who will arrive, and it is further a city that is noted for its live organizations of lumbermen and other business men who will certainly take care of the entertainment features of the convention in a style that will leave nothing to be desired.

Buffalo is a city which has made really remarkable strides of late in the growth of its population and of its industrial and commercial importance. As far as the lumber business is concerned it represents two very important branches of the industry, the rail shipments and the cargo shipments. It is an important distributing point for many large interests and, withal, its connection with the factors related to the National Wholesale Lumber Dealers' Association render it an entirely logical point for that organization to get together for its annual meeting.

The Forester's Annual Report

A PRETTY FULL SYNOPSIS of the annual report of the United States Forester will be found in this issue. It is important not only on account of what it contains, but for what it does not contain. There is not one word in it which can be construed as a defense of, much less an apology for, the Forest Service. Time was when half of the Forester's energy was used in defense of his policies and his work. Happily, that is no longer necessary, and all the resources of the Forest Service are employed in pushing ahead. The storms of hostility which were so common and so violent a few years ago have died in the distance, and, to paraphrase Milton, critics 'thave ceased to bellow through the vast and boundless deep.' The solitary voice of opposition still now and then raised, no longer disturbs the plans and progress of the work.

The report is a straightforward account of what the Forest Service has accomplished during the past year. It is a story of progress along the whole line, with no interruption or setback any-

where. The sales of government timber during the year amounted to 2,000,000,000 feet, in eighteen states, including Alaska. Most of the sales have been made to strong companies which are able to build railroads and carry on upsto date development.

A prediction formerly heard with frequency has failed to come true. It was feared that the government timber would be thrown on the market in such large amounts that private timber owners could not compete. In fact, there were not wanting men who owned no timber but who advocated that very policy for the purpose of providing lumber at or below cost to the people. That is, they wanted the government to use its timber to smash the lumber market. Such a course would have been the height of folly, and a policy like that never had any advocates inside the Forest Service or among sound business men outside.

Time is proving the wisdom of the course followed. No buyer of government tinder, as far as is known, has broken or disturbed any market. Such buyers pay too much for their timber to dump it promiseuously. They calculate as carefully as does the man who buys timber from private individuals.

The result is the atmosphere has cleared. This is apparent in the tone of the Forester's report from beginning to end. A well defined business policy has been inaugurated and there is no apparent reason why it cannot be carried to the end, though that end corresponds approximately with the end of time.

Give Justice Where It Is Due

IT HAS BEEN GRATHIYING to note the sentiment as expressed by the various lumber trade associations during the last few months regarding the proposed horizontal increase of five per cent in freight rates in the official classification territory. Practically without exception clubs and associations are placing themselves on record as desiring that the question be settled without partiality, and that if it be demonstrated that the railroads would really feel the continuance of present freight rates, they be given the benefit of the proposed increase.

HARDWOOD RECORD has contended since this question came up, that the railroads' case is a logical one, and indeed not considering technical evidence, the vast array of figures and statistics which will unquestionably be presented, the evidence as it exists is on the side of the railroads.

It is not logical to suppose that the various big systems of the country prefer to operate shorthanded as to men and equipment or that they would willingly run the risk of losses resulting from accidents due to poor road beds and to imperfectly repaired rolling stock. It is apparent, however, to all those in touch with actual transportation and to those who do any amount of traveling on the railroads, that the various systems of the country could very comfortably use an increased supply of rolling stock and motive power as well as passenger equipment and that the passenger's safety would be very materially augmented by thorough repairs on the road beds of a great many of the important lines, and that there are a great many other very necessary improvements which should be made.

Thus it is reasonable to suppose that the railroads would make these improvements if they could, and it is hardly reasonable to believe that they are foregoing such expenditures merely to create an object lesson which will assist them in securing the increases which they desire.

As the matter affects the lumber business, the activity or inactivity of the railroads has a great deal to do with the prosperity of that branch of business in general. For instance: The first indication of the present laxity in business was the beginning of the policy of retrenchment on the part of the railroads, which condition caused a general let-up in the demand for forest products. It is a known fact that the railroads as customers of the lumbermen are far more important than any other branch of the consuming industries, and hence it is evident that it should be the policy of those merchandizing forest products to give the railroads the benefit of the doubt, and support them in their contention for advanced freight rates, at least until it is conclusively proven that they are making such demand on false pretenses, and that their recent policies have actually been the result of a determination to intimidate the public.

That Ten-Hour Law in Arkansas

The cove SUPPLRING PUMBLER BUSINESS seems to be considered in a covered and according to the state of the bar. The Market seems to the state better of the bar. The Market seems to the complaint of the process of the considered considered that state in particular consists founds. However, the latest advices are to the effect that nothing very serious in the matter of actual process of the effect that nothing very serious in the matter of actual process of the effect that nothing very serious in the matter of actual process of the effect that nothing very serious in the matter of actual process of the effect that nothing very serious in the matter of actual process of the effect that nothing very serious in the matter of actual process of the effect of the plan which has been in effect for some little time among Arkainsas manufacturers, which was instituted solely in the interests of the men themselves. Thus by the insistence of the authorities on strict complaints of the constitution of the c

The matter hinges upon the question of working ten hours and a half for five days in the week in order that on the sixth day employes may be enabled to quit at noon. This as set forth by those in charge of the administration of the laws is a direct disobedience of the start better at the law, and must be stopped.

When the question was first seriously agitated a number of prominent manufacturers were made defendants and were threatened with severe fines. However, so far the result has been that only one concern was fined and then on only two counts, for \$25 on each. It is the purpose of the authorities, according to their statements, simply to enforce the letter of the law in the future rather than to prosecute those who have in the past granted this favor to their employes.

Unexpected Results

S EVERAL STATES and a number of nations have laws for the purpose of compensating employes who meet with accidents while engaged in their ordinary work. These laws have been in operation a sufficient time to give an idea of their operation along certain lines. Some of them are bearing unexpected fruit. For example, it was generally supposed that one of the first results of such laws would be to decrease the number of accidents. It was argued that employers would make conditions as safe as possible, for self-interest if for no other reason, and thereby lessen danger to workmen. It was further supposed that employes would be trained and instructed in the art of taking care of themselves; and that ought to result in a decrease of accidents.

Expectations have not been realized. One of the latest states to be treated to surprise and disappointment is Washington. Compensation for accidents brings more accidents. It has not been charged that employes deliberately injure themselves in order to collect pay for suffering and lost time; but somehow more accidents occur. Possibly some are now reported which formerly were not heard of. A pinched finger or a bump on the back may seem much more serious to a man if he expects pay for it than if he does not. In Washington the reported accidents have increased forty per cent since the compensation law went into effect. If results in that state stood alone, a number of explanations might be offered; but Germany has had the same experience, and a recent review says that the unfortunate feature is that cheating excites neither public contempt nor condemnation.

An instance is cited from records in Germany. Before there was compensation for injuries, the average time of recovery from a broken collar bone was from fifteen to forty days, depending largely on the age of the patient. The young recovered more quickly than those in middle life. Since pensions for the injured went into effect in Germany the average time required for recovery from a broken collar bone is eight months.

It is to be regretted that laws intended to benefit deserving unfortunates must be made a cloak to hide the false pretenses of cheats. There are always plenty of people trying to get something for nothing and they are quick to take advantage of every opportunity to accomplish their purpose. Persons of that kind are the greatest hundrance to real reforms and commendable charity.

The Year's Lumber Business in Chicago

T III and MALKMAN'S ASSOCIATION OF CHICAGO has published statistics of the lumber trade in Chicago in 1913. The quantity consumed broke all former records, though the amount reshipped fell a little below that of 1912. During the year just ended, the last year. The reshipments in 1913 totaled 941,821,000 feet, and in 1912 they were 996,956,000. The total amount of lumber in the Chicago market in 1913, including what was consumed and what was reshipped, was 2,801,303,107 feet, and in 1912 it was 2,642,650, 947. The gain is 158,646,160 feet. The lake receipts were 264, 48,000 feet in 1913, which was mearly 20,000,000 less than in 1912. Rail receipts were 2,536,958,000 feet in 1913, an increase of 150,858,000 feet over 1912. During the year 522,435,250 shingles were used in Chicago, or teshipped, which was a gain of 25,000,000 over 1912. The hardwood lumber on hand in Chicago at the close of 1913 was abo t 100,000,000 feet.

Chicago's claims to preëminent importance as a lumber center are pretty definitely established by these statistics.

Should Not Be Overlooked in Kiln-Drying

L AST ISSUE HARDWOOD RECORD contained an extensive article entitled "Scientific Lumber Drying," and an editorial comment on that article in which the following statement was made: "It does seen that the loosely piled load will dry faster than the one that is closely stacked. Isn't the capacity of a kiln determined by the amount of dry lumber it delivers rather than by the number of feet that can be crowded into it?"

The writer of the article referred to criticises some of the suggestions made in HARDWOOD RECORD'S editorial comment in the last issue, but says that he is entirely in accord with the idea expressed regarding the piling of lumber in the kiln. It is unquestionably a fact that the great bulk of stress has been laid upon the mechanical layout and actual operation of the various types of dry kilns as advocated by the manufacturers of the different drying appliances now on the market. It is also a fact that while in some cases the manufacturers of the different kilns of modern construction and design have investigated pretty closely the technical side of lumber drying as applied to the action of the different methods upon the wood itself, they have not given as much thought to the arrangement of the boards in the kiln during the drying process.

It is conceded that any proper chemical or mechanical effect which kiln-drying has upon lumber is of vast importance and cannot be too closely studied, and the results too closely observed. On the other hand, the arrangement of the boards as they are put into the kiln preparatory to drying is of almost equal importance and can be worked out along certain lines dependent upon actual rules of physics. It is not necessary, however, to delve exhaustively into the physical laws in order to arrive at proper methods in this particular.

The rush of work often necessitates crowding the kilns to their capacity, and here is where the mistake is very often made. Misunderstanding as to the term "capacity" as applied to the dry kiln in the editorial in last issue of HARDWOOD RECORD, is the keynote of the whole truth. It is natural that the owner of a dry kiln wants to get as much lumber through it in as short a space of time as possible, and he not only wants to get the lumber through, but wants it to come out in the most desirable condition. Hence, if he specifies a certain number of hours for certain species and thicknesses of lumber it seems reasonable on the face of it to suppose that he will get the biggest daily output from his kiln, observing his rules for specific classes of lumber, by loading his truck to the utmost capacity on each load. Such, however, is not always the ease as investigation might disclose that by piling his lumber more loosely he can dry it more quickly and also more thoroughly, and it might very easily work out that even were he getting good results from piling his boards comparatively solidly, the saving in time on proper drying in more loosely stacked piles might more than offset the additional lumber dried in each truckload.

Remarkable if True

"That case of Wedderby's is the most remarkable one I ever heard of."

"It is not so strange. Many another man has stolen \$50,000 from a bank."

"I know. But Wedderby didn't lose it speculating in stocks or spend it on a woman."

That's All

"Sure, Mr. Clancy, you've a foine lot of sons."
"It's right ye are, Mrs. Mulligan. I never have to lift my hand to them except in selfdefense."

More to the Point

"Of course you favor an elastic currency."

"Yes," replied Grandpa Mintlicker; "but I'd like to see some o' that good old-fashioned elasticity that 'ud enable a two-dollar bill to reach all the way around a family market basket."-Washington Star.

Point of View

"The point of view makes a great deal of difference," said the ready made philosopher.

"Yes," replied Mr. Chuggins. "When you are walking you think every automobile is trying to hit you. When you are driving a car you get an idea that every pedestrian is insanely ambitious to get run over " Washington Star

Red Gum According to Regions

The constraint of the first of the study the regions where the constraint of the con

It is readises to say that operous have undergone a cardical cristigs, which is a rational result of an increase an atomic good to proporties of the wood. It was not long after men began to self une to und it so table for many things that the discovery was made that all gum is not of the same character and quality. When that important fact was once understood, the next step was a search for the regions or districts where choice woods of the several and so were few-developed. That investigation has now been pretty thoroughly carried out, and large dealers in gum know where to go for the particular kinds which suit their purposes.

All gam lumber is either sap or heart. That means, of course, that it is cut from the colored heartwood or the pale sapwood. Combinations of the two are common in the same pile of lumber. Pretty close grading is necessary to obtain a shipment all heart or all sap, hecause both kinds are cut from the same tree. How ever, the region, soil, and situation have much to do with the preponderance of sapwood or heartwood in the output of a gum mill. Some trees are nearly all sap, no matter how large or how old they may be; others have thin sapwood. It is not a matter of accident. It is believed to be largely a matter of soil. The wood of small trees—that is, those of from one to five or six inches in diameter—are all sapwood. After that the colored heartwood begins to appear in the center. Gradually, as the trunk enlarges, the colored wood increases also; but there is always a band or zone of greater or less thickness of sapwood.

The interesting point is that some trees do not develop nearly so much heart as others. The sapwood in some is a long time in changing into heart, while in others the change is fairly rapid. The reason underlying the differences in the rate of change is believed to reside in the soil. Heart is nothing more than sapwood in which enough mineral substance has been deposited to give it color—to kill it and embalm it, as it were. This earthy material comes from the soil. It is carried up by soil water and is deposited in the cells and other vessels of the wood.

The fact that some trees have a large proportion of heartwood and others hardly any suggests that there is a difference between the soils in which they grow. Experience has largely sustained that view. Certain valleys, certain slopes, produce the trees which have never developed much heart. Those with little sapwood come from fairly well defined localities also. Buyers who want gum with little sap know pretty well where to go to get it. It is a matter of experience, not of theory. A certain locality produces timber of that kind and dealers know where to find it. The gum-producing areas of the South are now tolerably well understood by dealers. When they want a particular kind they do not need to hunt far.

The term "red gum" is the name of the tree. It does not necessarily follow that lumber cut from that tree will be red in color. That depends upon whether it is sapwood or heart. If it is the former it will lack the red color, though it comes from the red gum tree. Failure to bear that fact in mind has been the cause of many misunderstandings and disputes. A buyer orders red gum and expects it to be the red heartwood; but the seller cuts it from the red gum tree, and considers that he has filled the order properly, even if the shipment contains much sapwood.

Figured gum is another kind that seems to run by regions and areas It is largely independent—or seems to be independent

of the control of which develop heartwood or fail to revelop it, Arizo is too rave some heartwood and some sapt but by no means all of them have figure. It is also during a some and is absent from others, without any known reason. In that respect it is like bird's eye maple. It hits and misses. However, lumbermen now anow what regions to go to when they want figured gum. It runs by areas, districts, and localities. It is nearly absent from extensive tracts of fine gum timber, and present in others. Experience only can determine where to find it.

It is probably a natter of soil. In fact, it is difficult to assign ugaic in gum to any other cause; but it is not easy to explain just how the production of the figure is accomplished in nature's workshop inside the tree. Irregular deposit of coloring matter produces the figure, but no one has yet explained why such irregular distribution of the pigments takes place.

The deepest figures occur in the heartwood. Some suppose that they do not take place in the sap; but many a figure—a "watered grain," as it may be called—begins on the sapwood before the change to heart is accomplished. It would, therefore, seem that the deposit of the pigments which produce figure in gum are independent of those which ordinarily transform sapwood into heart, though there is no reason to suppose that the colors themselves are produced by different materials.

Many gum trees are figured in the Lutt logs and not farther up the trunks. It is said that the figuring process begins at the ground and works its way up the hole; but further investigation ought to be made before this can be stated as an established fact. Certain it is, however, that there is more figured gum in the lower than the upper part of the tree, though that cannot be said of the formation of heartwood except in proportion as the lower part of the trunk is larger and older than the upper portion. The making of red heartwood and the formation of figure seem, therefore, to be due to independent processes.

It is well known that red gum's figure is fundamentally different from the characteristic figures of oak, ash, and yellow pine. Oak's figure, in quarter-sawed stock, is due to the medullary rays, with certain modifications by rings of annual growth. The figures of chestnut, ash, and the southern yellow pines are due almost wholly to the rings of growth. Gum's figure is due to neither. The shades and tones cross the rings in every direction, though they sometimes follow them with some regularity; and medullary rays have no visible effect. The colors ramify through the wood, obeying no known law of growth or deposit of earthy matter.

It is in this that gum's figure resembles that of Circassian walnut. The latter, however, has a feature generally absent from gum. It is a modification of the figure due to the rings of yearly growth. The deposits of the pigments in the two woods appear to be much the same.

No fact is better known than that the figure and texture of Circassian walnut are influenced by soil and situation. Trees on their native mountains near the Caspian sea yield the Circassian wood of commerce; but the same trees transplanted into Europe will not grow the same class of wood, though some of the European walnuts have had the benefit of 2,000 years in that country.

Gum seems to follow the same law, whatever that law may be. Though red gum has been growing in this country since the Cretaceous age—some millions of years—there are large regions which do not produce any figured wood worth mentioning. Only in certain areas are the conditions right to develop it. Dealers have learned where to look for figured woods of this species. The gold miner cannot locate gold by studying geography, though that may give him a few hints. He must go and dig. When he finds what he is looking for he stakes his claim. The searcher after figured red gum does the same. He locates by exploration.

Some dealers are so well posted on the subject that it would be possible for them to make a map of the red gum's range and indicate the meas where choice figured woods may be obtained.

Annual Report of Forest Service

The country port of the leave States Levest School, to the scale of a galaxie of the new tree can also be Herri States expected with a school of the respect to the leave of the country of the leave of

In 1913 the total sales amounted to more than 2,000,000,000 board feet with a stumpage value of nearly \$4,500,000, as against less than \$00,000,000 board feet with a stumpage value of \$4,600,000 in 1912.

The sales business of the year showed operations in eighteen states, including Alaska, or in all states in which national forests are situated, except Kanasa, Nebraska, and North Dakota. The largest sales were in California, followed in order by Oregon, Montana, Washington, Arizona, Idaho, Colorado, Arkansas, Alaska, and Utah. In actual cut of timber the order is somewhat changed and the first ten states rank as follows: Montana, Idaho, Arizona, California, Oregon, Colorado, Alaska, Washington, Arkansas, and New Mexico.

It is pointed out that a large part of the proceeds will come in slowly, because extensive improvements must be constructed before cutting can begin, and because operations extend over a term of years. In most large sales one or two years are required for preliminary construction.

The increased sales were made up partly of relatively small contracts for local uses, but many large contracts were let for inaccessible areas whose product will be marketed in the principal consuming regions of the United States. Twelve large contracts were approved for an aggregate total of 1.552,398,000 board feet. The most important of these was a sale of 800,000,000 feet on the Sierra national forest, California, consummated after two years spent in estimates and negotiations. This sale well illustrates the policy pursued in developing inaccessible forest districts. Approximately seventy miles of railroad must be constructed into the Sierra forest, together with a complete mill and logging plant. Twenty-two years are allowed for the removal of the stumpage, with provision for readjustment of the price at intervals of five years.

Sales under similar terms were approved for 345,000,000 feet on two other national forests.

The most significant of pending transactions are three proposed sales of pulpwood, two of which are in the Tongass national forest, Alaska. The sale of 153,000,000 feet on the national forests of South Dakota will extend widely the local region supplied with lumber from the national forests in the Black Hills.

The main causes of increase in timber sales were: The partial recovery of the lumber market from the depression of 1909-11; the policy of making large sales which has encouraged substantial companies to seek locations in national forests; and the general stimulus to business in the West, due to prospective transportation by the Panama canal.

First in demand is the white pine timber of northern Idaho, now widely used to supplement the white pine forests of the Lake States. Second only to this white pine is the demand for sugar pine in California and for western yellow pine in California and castern Oregon and Washington.

The demand for Douglas fir on the northern Pacific coast has been less active on account of the enormous amount of private stumpage. There are, however, increased sales in western Oregon and Washington. The demand for western red cedar throughout the Northwest, generally, is very active, both for poles and for shingle stock.

Small sales, however, still form the great bulk of the transactions, indicating the continued local character of much of the

business. As compared with 1912, the number of sales of a variation of \$500 and less increased 6,26 per cent.

There were 1,333 different sales in Montana, the largest number of sales in any one state, this number Leing due to more than 1,200 small sales. In number of sales, Colorado, Idaho, California, Arizona, Utah, New Mexico, Nevada, Oregon, and Alaska follow in order.

In addition to the amount of timber sold there were given away 121,750,000 board feet of timber, with a total value of about \$192,000. This was disposed of under what are known as "free use permits," by which material is given free in limited quantities to local residents, miners, and others engaged in developing homesteads or mining claims on the forests. Most of the timber so given is dead, the proportion of dead timber being nearly three times that of green.

In making its timber sales the Forest Service has to keep in mind a number of different problems; its aim can not be simply to sell timber. It must prevent losses by fire; must utilize the ripe timber which can be marketed, and cut such timber so as to insure the restocking of the land and a continued forest production; it must sell ripe timber at the appraised market value as required by statute so as to give a proper return to the public which owns it; must prevent speculative holding of government timber and its monopolistic control, and use it as far as possible to maintain competitive conditions in the lumber industry.

Further, the national forests must provide for the requirements of local communities and industries, including the free use of timber and its sale at cost to settlers; make available for settlers timbered lands of agricultural value and at the same time prevent their speculative acquisition and encourage permanent and genuine farming; and finally, the forests should be made to return to the government as soon as possible the entire cost of protection and administration and to yield a revenue to the states which are entitled by law to 25 per cent of all gross receipts as an offset to the loss of local taxes through government ownership.

Most of these aims require no discussion; others still cause some comment.

For example: It has been urged that the government should. through low stumpage rates, force timber upon the market and thus reduce the price of manufactured lumber. The present policy, however, can not be changed without a change in the law. No such change is called for, says Mr. Graves. Sacrifice prices, unwarranted by actual market conditions, would reduce the returns to the public and to the states, but they would not reduce the price of manufactured lumber to the consumer. In the United States ninety-nine and one-half per cent of the timber cut comes from private lands. Competition in production is exceedingly keen. The mill capacity of the country is considerably greater than its normal consumption of lumber. This creates a constant tendency to produce more lumber than the market will take. During a period of depression actual overproduction appears; stock on hand mounts up; price concessions to attract purchasers fail to bring the hopedfor acceleration of sales, and as returns fall below the cost of production curtailment is forced. From 1909 to 1911 many sawmills operated at an actual loss because carrying charges on their indebtedness would not permit them to close down. One hundred and thirty mills in the two leading lumber-producing states were altogether idle in 1909. So long as competitive conditions obtain among manufacturers the lowering of national forest stumpage rates would neither benefit the consumer nor appreciably affect the supply of lumber on the market. One-half of one per cent of the total cut is too small a fraction to have any influence on prices; and although this fraction might be made several times as great as it is by offering government timber at a merely nominal charge. the effect would be simply to throw money away to procure the cutting of public timber in place of private.

Local demands are invariably given preference in the disposition

are covered, the converse states the entire yield is reserved for such that is Surab operators are particle rand concouraged as far as they are are area of experienced as a market the stumpage, the large sales form great state to a reasons be areas which small operators cannot exploit.

Problems concerning the most effective utilization of national forest timber are being studied. Such are the reduction of waste through closer manufacture and the production of distillates or other Ly points, the extracting of naval stores as an accessory to lumbering, the use of inferior lumber species for the manufacture of paper and the promotion of new or more valuable uses for particular spends through preservative treatment. One of the most signal cant of the recent revelopments in national forest sales is the demand for various western species for the manufacture of pulp and paper. The forest products laboratory has demonstrated, through experimental runs of pulp and paper and tests of news print in actual use, that many western conifers are well adapted to the manufacture of news print and other standard grades of paper. These are particularly the red fir of California, the Engel mann spruce and lodgepole pine of the Rocky Mountains and northwestern states, and the Sitka spruce and western hemlock of the northern Pacific coast and Alaskan forests.

Exceedingly valuable and practical results have also been obtained through demonstration of the desirability of telephone poles cut from the lodgepole pine and treated with preservatives at the butt. The supply of western red cedar, hitherto the standard pole timber of the West, has become greatly diminished. In consequence, market prices are high, particularly in the Rocky Mountain region, where the cost of long freight hauls must be added to the first cost of the timber. It has been shown that lodgepole pine poles are stronger than cedar poles of the same

timensions and, with preservative treatment, more durable.

The increasing volume of timber sales carries with it increasing costs to estimate the timber, to transact the sale, and to supervise

the cutting operations.

During the year timber cruising was extended over 3,867,627 acres of national forests. This work involves an estimate of the standing timber, the most practicable methods of exploitation, the extent and character of young growth, and other matters which affect management. A total of 17,512,342 acres of national forest land, or about one eighth of the timber area of the country, has now been cruised.

This cruising must be done before timber sales are made, to settle questions of title, to determine what cutting is advisable, and to fix the price. In fact, the expansion of the timber sale business depends upon the ability of the Forest Service to estimate and appraise the areas in demand. Timber estimates are the first step not only in making sales, upon which the forest revenues mainly depend, but also in the preparation of working plans for the systematic development and use of all forest resources. This phase of national forest administration is increasing in importance as use of the forests increases. Systematic plans are now becoming urgent on forests like the Coeur d'Alene and Kaniksu, in the white pine belt of northern Idaho, where the demand for national forest stumpage is exceptionally keen; the Whitman in eastern Oregon, which is supplying a large local lumber industry up to approximately its maximum capacity; the Deerlodge in Montana, which is drawn upon heavily for local mining timbers; and the Black Hills and Harney in South Dakota, whose cut is rapidly increasing and will soon approach the maximum amount that these areas can produce. Working plans for such forests are being developed and perfected as rapidly as practicable with present funds.

Judging the Quality of a Wood

No two woods are alike, and for that matter no two specimens from the same log are identical. There are certain properties that characterize every wood, but in any case they are subject to considerable variation. Oak is a hard, heavy, and strong wood, but some pieces, even of the same species of oak, are much harder, heavier, and stronger than others. With hickory are associated the properties of great strength, toughness, and resilience, but some pieces are comparatively weak and brash and ill suited for the exacting demands for which good hickory is peculiarly adapted. Many woods have reputations for great durability, yet specimens of them are constantly failing to live up to their reputed qualities.

It is evident, then, that woods should be chosen with due regard to the uses to which they are to be put. Woods best for some purposes are not adapted to others and the greatest economy of material will result when materials are employed for the particular uses for which they are suited. In grading rules in common use, timbers and boards are sorted into classes according to defects. This is good as far as it goes, though difference of opinion may arise as to what is actually a defect.

The use of wood must be taken into consideration in defining defects. For instance, sapwood is discriminated against in some cases while in others the presence of heart is objectionable. Knots are almost universally considered defects, yet in some instances the presence of sound knots may not only do no harm but actually help. For instance, knots have little if any appreciable effect on the stiffness and compression of wood, may increase a beam's resistance to longitudinal shear, and may produce pleasing decorative effects in panels and furniture.

If strength is the prime consideration in the choice of wood material, it is not sufficient that the timber be free from visible defects. Given two equally sound and dry pieces of the same dimensions, of the same species, and possibly from the same log, one of them may prove a third stronger than the other. This

is due to the fact that wood is not a homogeneous material like metal or concrete, but an intricate structure produced by growth. Variation in the soil in which the trees grow, in the available amounts of food, light, and growing space, as well as the vitality and age of the trees will be reflected in the kind and quality of wood produced. It is well known, for example, that swamp-grown timber differs from upland timber; forest-grown timber from second-growth; slow growth from rapid growth. So many factors enter into the production of wood that generalizations are likely to be misleading.

Thousands of careful laboratory experiments have been made to determine the strength and other properties of woods. These are very valuable, indeed, and there is need for much more work along this line. The results of such tests, however, prove the great variability of woods even where selected specimens of the same species are used. From such data average figures for strength, elasticity and stiffness are obtained for use by architects and builders in designing and construction. Yet the average wood, like the average man, is not commonly met with. In making practical use of such data the figures must either be low enough to include the weakest pieces to be used, or what amounts to the same thing —a factor of safety must be employed which will allow for the variation in the material. The logical outcome is that if only the best quality of wood is employed the structure will be stronger than necessary, and a waste of good material will result.

As previously stated the grading rules for different species and classes of timber are based entirely upon the number and character of defects in the material. The results of exhaustive tests clearly demonstrate that such rules are for the most part not effective in classifying structural timbers according to their strength. The formulation of rules that will accomplish this result is beset with difficulties. One is the lack of sufficient data as the basis for such rules, though this is in a fair way to be overcome. Another is

the wood-user's failure to appreciate the need for such rules. With decrease in the supply of virgin timber, the quality of timber on the market steadily decreases, making revision of grading rules necessary. The time seems sure to come when timber will be graded not on defects alone but according to its strength, or with special reference to the use to which it is to be put.

What are the factors upon which such rules could be based? If strength is the feature most desired, it will be necessary to grade materials with this end in view. How can the comparative strength of woods be told by inspection? The answer is found in the exhaustive tests that have been and still are being made on woods of various kinds. Take two pieces of wood of the same species and of equal weight, dryness and freedom from defects, and the stronger of the two is the one that contains the most wood substance. Cottonwood is light because it contains so much air space; hickory is heavy because it contains little air and much wood substance. If a wood were solid, it would sink in water like a stone.

If one piece of hickory, say, is stronger than another piece of hickory because it contains more wood substance, and the more wood substance it contains the heavier it will be, then the comparative strength of the two pieces can be inferred from their respective weights. Within the same species, the heavier a wood is the stronger it is. This, of course, can apply only when woods are equally sound and equally dry. Green wood is heavier than seasoned wood, but it is also weaker, unless as a result of improper seasoning the occurrence of checks and splits offsets the gain in strength due to dryness. So often is the latter the case that strength values for structural timbers are usually based on green material.

If kiln-dried or thoroughly air-seasoned material of the same kind is being graded, it is impossible to judge the relative strength by the weight. With many different sized pieces this would be more difficult; with green wood it would be practically impossible. Increase in the amount of wood substance means increased density and this can, in a great many cases, be judged by the eye. This is particularly the case in pines and other conifers. If you examine a piece of southern pine, for example, you will note that it is composed of alternate layers of light and dark portions. Try them with your knife and see how much easier the light colored portion cuts than the other. Try indenting them with your thumb nail and note how much harder the dark colored band is. It follows that the greater the proportion of this dark colored or summerwood a piece contains, the heavier, harder, and stronger it will be, and vice versa. Hence in choosing a coniferous wood for strength pick material that shows to the eye to be the densest. Wood that contains one-third summerwood may be classed as dense wood.

Another way to determine the density and therefore the strength of material is by its resilience and resonance. Strike a piece of wood a blow with a hammer or similar blunt tool. If the hammer shows a marked tendency to rebound without indenting the wood it indicates resilience, which is a criterion of strength. Dense woods give out a clear, sharp tone when struck, thus affording still another means of judging quality.

Some grading rules go farther than others and attempt to classify woods according to the number of rings per inch as seen on cross section—in other words, upon the rate of growth. There is no question but that rate of growth does affect the properties of a wood, but it is not always possible to state just what the effect will be. It is quite frequently the case that in conifers slow growth produces harder and stronger wood than rapid growth. Consequently wood showing not less than eight rings to the inch is considered strongest. Such a rule is included in most paving block specifications. In the case of wood cut from the outer portions of large overmature trees the rate of growth is slow, but the material is soft and comparatively weak. Sapwood from large western yellow pine trees resembles white pine and is sometimes marketed as such. It is evident, then, that in conifers ring width is by no means a criterion of the quality of the wood.

With equal proportions of dense summerwood, however, narrowringed woods are usually stronger than wide-ringed, and are more even-textured.

In the case of hardwoods the same rule holds that the greater the proportion of summerwood, the harder, heavier, and stronger the material will be. It is also true that wood from the outside of large, overmature trees is lighter, softer and weaker than that from more thriftily growing specimens. Hardwoods may be divided into two groups one in which the large pores are collected in well-defined rings or bands-the ring-porous woods like oak, ash, chestnut and hickory; the other in which the pores are of much the same size and scattered rather uniformly throughout the annual ring the diffuse porous woods of which poplar, gum, maple and birch are common examples. In the diffuse porous woods there appears to be no definite relation whatever between the width of ring and the strength of the material, though a medium rate of growth is usually stronger than very fast or very slow growth. Here density of material is best evidenced by the appearance, by the weight, and by the response to a blow of a hammer.

In the case of ring-porous woods wide rings are closely associated with strength. Hence, if one is choosing oak or ash or hickory for such exacting purposes as handles, spokes, tongues, shafts, and such portions of furniture as withstand hard usage, he should choose wood with wide rings. If, however, one wishes to use such woods where ease of working, lightness, and reduced shrinking and swelling are more important than strength and weight he should select material showing as many rings to the inch as he can find. Slowly grown, ring-porous woods contain much less hardwood fiber than rapidly grown woods of the same group, and consequently have greater strength and hardness, but are also more likely to check in seasoning and are more difficult to work. This explains why ''second growth'' ring-porous woods are often preferred to forest grown material, as is the case in hickory for handles.

In the hickory trade "second growth" has come to mean the same as sapwood, the grades being hased largely on the color of the wood. It is quite easy to see how this condition may have come about. The term "second growth" is usually applied to young timber growing in rather open stands, therefore growing rapidly. Such trees contain a very large proportion of sapwood, in some cases may be all sap. The wood being harder, stronger and tougher than that from old trees growing slowly in the forest, a natural preference arose for the second growth timber, and as it is white in color, the desirable properties came to be associated with the color and not with the ring width and density of the wood, as it should.

Other things being the same, sapwood and heartwood are equal in strength and toughness. Very often, however, other things are not equal. Heartwood, being at the center of the tree, is more subject to defects such as knots, shake, worm holes and decay, which may materially weaken it. On the other hand the sapwood occupies the outer layers of the tree and in large specimens is of slow growth and, for reasons explained above, often lighter, softer, and weaker than the heart. It is evident, then, that strength is not dependent upon whether a wood is heart or sap, but upon the structure and condition of the wood without reference to that question.

There are various ways, however, in which heart and sap differ. One is durability or resistance to decay. The sapwood of no species is durable in contact with the ground, the same being just as true of cedar or cypress as of any other wood. Neither is all heartwood durable, though in any case it is usually more so than the sapwood. In scleeting woods in which natural durability is the essential consideration one should discriminate against sapwood and in favor of heart, and especially in favor of dark colored heartwood. If wood is to be impregnated with preservatives, sapwood will be found to afford much easier penetrance than heart in all cases where a distinct heart is present.

Not only is sapwood more likely to decay and stain, but is also, especially in the manufactured form, more liable to insect injury,

The recoverage rection to completely destroy arry separate elements, and construct the same of the first desire in the case of which is the received the same of the recoverage matter and the case of which is a perfect to the natives to bury the peeled logs for six or eight relation beave than weight the people logs for six or eight relation beave than weight the people logs for six or eight relation beave than weight the people logs for six or eight relation beave than weight the people logs for six or eight relationship to the same with the remover the same which is notabless and with respective transporting out of the country.

There are still other factors entering into the choice of a wood for particular purposes. If case of splitting is desirable, the fact can be determined by a close inspection of the arrangement of the wood elements, especially with the aid of a good hand lens, or by splitting off of a small piece. Woods with spiral, cross or twisted grain are hard to work and more likely to warp than straight grained material. Much depends on the sawing, for even the best of logs may be spoiled in cutting them up, and still more is spoiled by improper methods of seasoning. It is encouraging to note that an increasing number of lumber manufacturers realize that proper seasoning means very much more than the mere drying of word.

There are a multiude of uses of wood for which there can be no satisfactory sul-stitutes. There are many others where competition with metal, concrete, and other substances must be constantly fought. It is important that every manufacturer know his product, its good points and its limitations, and so grade and select his material that the best results can always be secured from it. Every effort should be made to standardize the different grades of wood, for in this way much of the uncertainty that at present exists regarding the properties and qualities of timber will be done over with an time use of wood thereby stimulated. S. J. R.

Camp Management

Editor's Not

The following poper was read by U.S. Hammond of Re. 1 is: Will before the meeting of Michigan and Wisconsm regrets at Green Bay, on Saturday, December 6. For make of paper it has not appeared before. It contains some single-stime that are decidedly worth consideration on the sun of thome campe managers, as they are suggestions based on a green many years experience in Lacartry Jan Pin, of woodsmen

An agreement as to the services of the cook should be made before the cook goes into the woods and a copy forwarded to foreman. The agreement should state explicitly what services he is required to render, about how many men he is supposed to handle, how much help he is to have and what he has represented himself to be. This gives the foreman an idea of the situation whereby no misunderstanding will arise. He will represent himself to be an excellent cook and capable of handling a certain number of men, but when he gets to the woods he is generally a different man all together. If the foreman is expected to check the cook, it will prove a failure in most cases, as this part belongs to the man in authority in conjunction with the foreman.

In the past our cooks have always been in the habit of serving two, three or four kinds of meat, as they deemed best. We have started in this fall with strict instructions in writing that only one kind of meat be put on the table at a time. Cooks will often try to overcome this with excuse that they had some left over. For your information I wish to say there is always something left over. One of the most wasteful items we have to go up against is too much food being cooked ahead. It gets old, mussy, and sour, unfit to eat and is thrown away. Sometimes they have hash, stew and roast at the same time. This should be strictly forbidden. Of course some leniency and allowances should be made, but the idea is to hold to one kind of meat at a time on the table.

I feed the men all the cake, pie, pudding and fruit for sauces they can eat. I put two kinds of sauce on if necessary, for I believe in filling them up on anything they will eat outside of meat. Pies, cakes, pudding and fruit sauces are not usually thrown in the slop pail, and if too much is cooked ahead, it will generally be cleaned up. Some people advance the idea that men are not able to perform the same amount of labor on sugar products as on meat and potatoes. To offset this, I will say that they don't usually remain long enough to cut much ice and if they want to fill up on pie and cake, let them do it. If they are unable to perform work let them hit the tote road. I don't know but what one gets just as much labor out of the men under such conditions as they do by confining them to pork, beans, beef and potatoes. Too heavy food is just as bad as too much pie and cake. We give them ginger snaps, sweet, graham and soda crackers.

I recently purchased one hundred pounds of strained honey at nine and one-half cents per pound. I believe this will be used on bread, biscuits and pancakes, and be good, healthy food.

All canned and package goods should be standard. Some people seem to think you can put any old thing on the table for lumberjacks, but we believe everything you serve in camp should be first class. It doesn't have to be the best, but it should be new stock, as it goes a long ways toward the health of the men, and we find they like it. We give them canned tomatoes, peaches, apricots, apples, grated pineapple, etc. We do not furnish any extracts, but let them use the grated pineapple to season puddings, cakes, rice, etc. They seem to like the prepared breakfast foods and use condensed milk with it, reduced eight to one with luke-warm water. We don't use cold water.

I find that sardines, dried fish, salmon, rice and cheese go very well. Cheese can be used in conjunction with macaroni. If the cook adapts himself to getting up these little side dishes, they are very acceptable and are enjoyed by the men. A good cook book should be furnished each cook.

It is the universal custom to feed men well in the woods, and the principal point in feeding is to have a good, clean cook. Give him good tools to work with, a good stove and camp, then see that he makes good and keeps everything clean. As I said before, don't depend too much on the foreman to line up the cook. The woods superintendent should attend to this. Don't wait for the men to utter kicks, but do the fault finding yourself. If one cook can't make good, give him his time and find someone who can. Cooks sometimes start in well but get lazy, dirty, wasteful and cranky. Don't put up with a cranky cook. Make it a practice to go into the cook camp every day and stand around a few moments to get acquainted. Your presence on the job is something. Keep him lined up today, tomorrow, and the next day, by careful management, and always use due courtesy. Cooks are usually human beings and like human treatment. The idea is to show them you are interested.

If the cook gets angry, as he sometimes does, try to reason with him, but if there is no reason in him, hire another as soon as possible and let him go. If he is going to quit on the spot, don't pay him a cent, but sue for damages; and be sure to make the damages large enough. It doesn't do to let any cook run the bluff on your pocketbook and you. In the logging business you will find that one year you have trouble with cooks, but the next year the loaders will give good satisfaction, but you will have trouble with teamsters. Next year you will have a lot of trouble with the foreman. In other words, in employment of labor, there is always trouble and it is up to the superintendent or employer to stand behind and with the foreman.

We hire men under two wages, for \$26 to \$35, or from \$35 to \$40 per month and board. This year we have hired by the day: \$2 per day, and allow \$4 per week for board. This figures out to

about \$32 per month. We are now remeing wages to \$1.85 per day and \$4 per week for board, not issuing stips to employes. A carbon of the same is kept in the bring book. You can readily see that any kind of an arrangement can be entered into with an employe who is not asked to sign the slip. It you ask him to sign, he will refuse. Whatever understanding we have in regard to wages and services he is to render is written on this slip.

I wish to say right here that laws are such that you are compelled to gay an employe what you hire him for, provided he works at the job you hire him to a. Any cleange of jobs makes a change of wages, provided the employer so wishes. If a man is hired at \$26 per mouth to swamp, and he is put top loading, he can collect wages of a top loader; or it he is hired at \$40 per mouth to top load, and he is mable to perform that work, you are paying for such work. Again, if you hire a man by the mouth, under the law you are compelled to give him employment for a mouth and he is compelled to work a mouth, provided he does as he agrees. If you fail to give him employment for thine, he can sue for a full mouth and collect.

In hiring under two wages I find there is a good chance to pay a poor man off at the lowest wage. Again, the question must be distinctly kept in mind, of paying a man full value for his hire. If you pay a good man good wages, he will always like to come back and work for you. It doesn't look well or work out well to pay the same wages to all kinds of laborers—that is, pay the poor employe the same as you pay the good. Treat the men on the square when they treat you on the square, and you be the first to give this good treatment. If they try to give poor service, come back with poor pay and a law suit if necessary. If an employe threatens to sue, I tell him to sue, and I fight my case on general principles. Very few sue, as they know I will fight.

Right here comes the question as to who is going to settle with these men. The superintendent will have to attend to some of this. Unless a foreman has a very strong back, he will break down if he attempts to do it all. You might say it is impossible for the superintendent to be on the job all the time. I will admit this to be a fact, but he can arrange his office and other things so that he can help some, and if it comes to a showdown, he can give the foreman a certain amount of responsibility; but the greater part should be assumed by the woods superintendent when it comes to settling the low wage question. This can be done in conjunction with the timekeeper and office force. Men get down on the fellow who advocates low wages, and as the foreman is with them all the time it is sometimes hard on him.

We always aim to construct the office with a desk in front, running across so that the men cannot come into the main office. If you do not keep them out, there will be a bunch in at times and they will sit around the foreman or timekeeper, look over his shoulder at the books, keep talking to him, and there will be either a row or the foreman will have to pay them off at any wages they demand. Often they have to allow two, three or four days extra. The idea is to get rid of them any old way. You must always bear in mind that a camp clerk or woods foreman is up against a hard proposition when he comes to settling with men. It is a good plan for large loggers to have an officer around the camps all the time, for protection in some instances. You may laugh at this, but nevertheless it is a fact.

I don't believe it pays to have regular pay days in the woods, for the reason that it does not work out well. Sometimes you have a good man and want to pay him \$5 additional, but if you have regular pay days the men would receive their time checks and you would have to pay the poor man about the same as you do the good, and you will find in the end that it raises the wages considerably and makes a great deal more dissatisfaction than paying the other way.

We aim to send money to wives and families of married men just as fast as it is earned, if they so desire, but we try to size up the young fellows. If they are in the habit of coming to the office and asking for \$2 or \$5 as fast as it is earned, we head them off on the start Ly asking, "What do you want to do with of?" If the care of give a good explanation, we octase to give them money. If they don't like it and quit, we give them what they have coming and cut down the wages. If all would do this it would stop some of the boaze fighting and dissatisfaction.

I usually cut every man on his wages who jumps camp. If he wants to go I say, "What is the matter?" or "I have no man to take your place," or "You agreed to stay until camp breaks and I want you to do as agreed," He, however, wants to go so I tell him to take some money, go and have a good time, then come back. They often do this. By so doing you hold your good men. If a man still insists, I usually cut him \$5 per month. This has an effect of holding him. Fifty days is long enough for men to stay in the woods. Let them lay off a few days and they will work better when they come back. This holds good with the foreman as well as with the men.

Have plenty of straw bosses. Pay them from \$5,00 to \$10,00 more per month and they will work with their crew. If any of these foremen, straw bosses or men want to go home or on a drunk, you always have some left. Make the men understand that you want to feed, pay and treat them well. If they try any slippery tricks cut the wage. If you do this, things will run pretty smooth unless you get a camp inspector or disturber in the crew. Just as soon as you find this out let him go. Usually some of the men will go with him. If you are on your job you can smell this in the air. The little birds whisper it to you. Now comes the time when your spinal column needs to be braced up.

I assume the position that if a man wants to get drunk he has a perfect right to get drunk, provided he does not do it on our works and to our injury. He comes and asks for \$20 or \$25 and we ask him what he wants it for. If he says it is for a good time we say, "Here is your \$20; go, have your good time, but stay there until you are through, for if you come back to camp drunk. we will fine you \$10." I want to say right here, I have had these notices up in camp and have fined men as high as \$50 for creating disturbance in camp. In one instance this was done when I was logging at Frederic, Polk County. A man got drunk and chased the cook out of camp with a knife. As far as law was concerned in that locality, it was practically out of the question. You will find in these small towns that it is a pretty hard proposition to do much with lumberjacks on the law question, and the only course to pursue is to take the law in your own hands by holding on to the money. It hurts the lumberjack, and I find it is a good way to make him fall in line, provided you have the sand to do it.

Advancing fares is another very important question. Stop this advancing fares for employment agencies and labor. If men have not money to pay their own fares, you will find they will take the blind baggage or tie pass, and in the end they will be very careful to save a little money to get out where the job is. To advance \$500 in fares and not receive over \$100 back is a foolish proposition. In the spring you will have a nice big warehouse full of old dirty baggage. Employment agencies hold up before your eyes the fact that the other fellow is advancing fares and if you want any men you will have to do the same. This is all nonsense. There are only so many men to go around and if one camp gets filled up there will be enough for the other fellow: or if there are not enough to go around by doing business this way, there would not be enough by doing business the other way. If we expect to do our logging in the future by advancing fares through employment agencies, you may as well make up your mind that it will cost \$1.00 per thousand extra to log. I believe employers and the laws of Wisconsin are as much to blame for the labor conditions today as the employe. Men usually go South during winter, as weather is warmer and gives a better chance to play the dead beat, and our laws uphold them. Lumbermen should spend \$100 in advertising every fall or at any time labor is scarce. For instance, if you want 100 men, advertise for 500. Try it. I will venture to say you will get swamped with inquiries.

He is be to grown as except the object out circular letters, describing our atoms grown asswering and prestions that might arise,

Early voir camp to bold from acoust thirty to lifty per cent more men than are required, no sonal, during November, December and Jaccary there are plotts of not to be had at from \$20 to \$50 to common late. Here everyone that comes along, fill the camps full, buy extra tools, lay out all your work ahead, cut roads, grade them, cut out skidways and landings. If you hire teams, bade trains for two the teams necessary. Days are short but wenther constrons are isonally good. The idea is to log rapady too about these months. After February I men and teams to give to quit. If you have taken all these precautions you work will be well always.

On two other mand, it con construct small camps and small brains, you are always behind with your work, short of men and teams, and always hunting after these things, offering higher wages to get them than you would have to do otherwise. It you bear of some company paying high wages, send them all the poor men you can. They will soon get filled with a lot of trash and the elogong will cost them 510 to 512 per thin-sand. There are concerns whose logging costs them all of this, but they won't sown in to it.

Our state is making laws to shoulder expense on us. We should match brains and muscles with them. Get ahead of them or they

will drown you with heavy assessments. For example, why don't they enact laws that will do something with this large floating bunch of paupers? Do you know that lumbermen are feeding, clothing, doctoring, and in case of accident, caring for some old uncle or aunt that was never before heard of? These accidents are caused largely by negligence of fellow workmen who are debauched, debased, ignorant, with demoralized minds filled with the anarchist's belief that the more he destroys the more labor he treater.

Logging is like war, especially if you are a logger. You have to get logs on the landing or bust. No man wants to bust, or make failure of his business. In logging, you must always go ahead and keep going. As long as you are paying the bills you have the say. Treat everybody right if they will let you. If they will not, you are not to blame.

Now comes the question of the superintendent. Is he big enough for the position? If he is not capable of filling this position, it means expensive logging. It is much harder to obtain good logging superintendents than it is to obtain good men to run your sawmill. I believe that, if superintendents were financially interested in the company it would be better for the company. They should have the brains and diplomacy of a United States president and the fighting qualities of a John L. Sullivan on order to succeed and make successful loggers.

The Lumbermen's Round Table

THE TARIFF AND BUSINESS

A leading hardwood manufacturer, who is a close student of general business conditions, realizing that the lumber trade is more affected by fundamental conditions than any other business except the iron and steel industry, was commenting recently concerning the effects of the revision of the tariff.

"The banks and others who look only at the theoretical side of the situation," he said, "are accustomed to dispose of a matter of this kind by saying that the effects of the tariff have been "discounted" by business men. That simply means that the stock market has figured the probable result of the change. It does not mean that business itself has felt the effects or takes account of them.

"On the other hand, 1914 will be well along before the actual, definite results are indicated. Jobbers and other large buyers of foreign goods will not put them in shape to market until next spring; and many foreign manufacturers, who are contemplating an invasion of America, are just now feeling their way, and will make a definite attack on our markets some time in the future. It is only when they have exhibited their strength and measured swords, in a business way, with our manufacturers that we can say how much or how little the effect of the tariff has been.

"The lumber business and most wood-consuming industries, as a general thing, will not be directly affected by changes in conditions. But the lumber business will be affected to a very considerable degree indirectly, and for that reason the tariff situation will be worth watching closely from now on."

THE MAN WITH NO INSURANCE

Many times one reads in the daily papers of the complete destruction by fire of a sawmill or other woodworking plant, with the notation at the bottom of the item, "There was no insurance on the property."

It is fairly easy to explain why many sawmills are unprotected by fire insurance, in spite of the fact that their construction and the conditions of operation make the fire hazard an item of no inconsiderable magnitude. These very factors make for a high insurance rate, and a high insurance rate discourages the purchase of insurance. Thus the owner who really needs protection the most frequently goes without any at all. It is a sort of lefthandest method of reasoning that the man with a poor risk cannot afford insurance, but that is the logic of many lumbermen,

If the sawmill man doesn't want insurance in a stock company, or feels that he can't afford it, let him get into a mutual organization, whose rates are usually lower. By all means, unless he has a fireproof mill or a sufficient number of plants to be able to scatter the risk, he should protect himself from the heavy loss that a fire causes, by providing some sort of indemnity.

A TIP FOR THE MACHINERY MAN

A furniture manufacturer, who has a large plant and is frequently in the market for machinery, recently made a remark which may be worth quoting for the benefit of salesmen of machinery, not to mention lumbermen who have occasion to solicit that class of trade.

"I have found the tendency to exaggeration so strong among salesmen," he said, "that I discount the statements of the average solicitor about fifty per cent. Machinery men are among the worst offenders in this regard. They will promise achievements which sound incredible—and usually are. I have put in machinery on the strength of such promises, only to find that while the new equipment did reasonably good work, it did not do the phenomenal things which had been promised for it. It was a fairly good investment, and not a record-breaking one.

"Hereafter my requirement is that the man who makes assertions must back them up with something more substantial than wind. The next man who sells me a machine on the strength of claimed performance must give me a written agreement to take it back at the price I paid if it fails to do what he has said it will."

UNIFORM COST ACCOUNTING

Everybody nowadays believes in cost systems. Everybody knows that to get along without knowing the expense of production is to assume an unnecessary handicap of considerable proportions. In order to have the right point of view, and the right outlook on the business, the manufacturer must know what it is costing him to turn out the goods.

But one of the important developments nowadays is the demand for uniform cost systems. Lumbermen and others not only want to know what it costs them to operate, but they want to be able to compare notes with others in the same instructions on some intelligent lasts. To no this terms are notified used in arriving at results must be common; otherwise the comparison is of little benefit.

Frequently there is a wide variation in figures quoted by two different manufacturers as to the cost of performing certain work. This leads to an analysis of the figures, to determine how they were arrived at. Usually this indicates that different methods were used, and that one man included certain things that the other left out.

In order to avoid the necessity for such analysis, and to make a comparison of real value without questioning the method used, uniform systems ought to be employed. Sawmill men, planing-mill operators, furniture manufacturers and others who are studying costs should consider uniformity as carefully as they consider accuracy in luiding a cost system. A standard system used by everybody is immeasurably superior to a score of methods indiscriminately employed.

THE IDEAL FLOORING WAREHOUSE

One of the most important problems which the manufacturer of hardwood flooring has to contend with is that of keeping his stock in storage in good condition. The conditions of the business are such that a large amount of material is carried on hand, some of it remaining in the warehouse for months at a time. Protecting it from moisture and from wide variations in temperature is a necessity of the manufacturer. A lot of care has been given to the work of keeping it in good condition. Heating arrangements have been made which maintain an even temperature all the time. Walls and floors have been built with a view to excluding and eliminating excess moisture, and the stock of flooring is looked after as carefully as a week-old baby.

This is all necessary and desirable; but at the same time it should be remembered that the flooring not infrequently passes through several hands before it reaches its ultimate place, in the floor of the user. Does the manufacturer protect his product, or see that it is protected, from the time that it leaves his warehouse until it is used? If not, then much of his effort at the factory is wasted.

The flooring man who is proud enough of his goods to stamp his trade-mark on each piece should also see to it that they are properly handled by dealers and contractors, so that the ultimate user will get the sort of material he has a right to expect.

THIS GRADER WORKS BEHIND TRIMMER

A trip to the mill of a prominent Indiana operator recently disclosed several interesting features, one of which particularly is of rather vital importance, or at least touches a question of vital importance, namely, the grading of lumber. This gentleman goes on the theory that one man should be responsible for getting out the entire product of the log as far as actual money value is concerned. He believes that the man who naturally should have the supervision of that work is the man who actually puts his mark on the boards designating their actual worth. That man is the grader, who in usual operations works alongside the grading chains.

At the mill in question, however, the owner, who is pretty well noted for his sagacity, has decided that inasmuch as the grader is responsible he should be in closer touch with the operations. Hence, instead of putting him at the grading chains he is placed immediately behind the trimmer. Thus he can get in instant touch with the sawyer the minute he sees there is anything wrong with the manufacture of the lumber coming from the band saw, and valuable time will not be wasted and valuable logs sawed up into mis-manufactured stock while the grader is going through the process of informing the sawyer and shutting down the mill to change saws.

The grader in this case is given absolute authority over the entire organization, and the operator says that the scheme is working out to a nicety.

TRIMS VENEER AFTER DRYING

The wisdom of the usual process of truming rotary ent veneer before drying has been questioned by a certain manufacturer in North Carolina, who says that he reverses the process and trims his stock only after it is dry. He says there are many advantages in this method of operation, and that he has yet to discover any disadvantages. According to this particular operator he saves about fifteen per cent in the actual amount of waste resulting from trimming, and turns out a far more uniform product than he could possibly do it he were to trim his stock first and then allow it to shrink to the segmentage of the relation.

The suggestion does not have anything in it of a particularly radical nature, and inasmuch as it has been very successfully tried out by this North Carolina man, it would seem that it is worthy of consideration on the part of other manufacturers of rotary stock.

Memphis Log Supply Not Promising

The movement of timber from the Mississippi valley to mills at Memphis and elsewhere in this territory promises to be comparatively light during the next three or four months if weather conditions are not such as to make logging operations possible on a scale larger than normal for this time of the year. This outlook is based on reliable information to the effect that the supply of timber on the Yazoo & Mississippi Valley line of the Illinois Central System awaiting loading is not more than from twenty to twenty-five per cent of the corresponding time a year ago. The movement during the four months beginning August 1 was exceptionally heavy, but the indications now are that the small movement which became evident around the first of December will continue in force for some weeks unless, as already suggested, the weather is such as to make the preparation of timber for shipment possible on a pretty full scale.

From Arkansas a better movement of timber is promised. This is particularly true of the territory served by the Memphis-Marianna cut-off of the Iron Mountain System and the Missouri and North Kansas roads. Both of these lines are comparatively new and the timber in the sections traversed thereby is closer to the railroads because the development is in its infancy. This means a much shorter haul and it also means logging conditions much more favorable in some important particulars than those in the delta. The Valley Log Loading Company is operating now on the Memphis-Marianna cut-off and it reports that the amount of timber awaiting handling is much larger, proportionately, than on the Yazoo & Mississippi Valley road.

The amount of timber arriving by water is fairly large and conditions, from the standpoint of water transportation, are somewhat more favorable, so far as some of the tributaries of the Mississippi are concerned. This applies particularly to the St. Francis river, on which timber is now being moved in large enough volume to enable some of the plants which were closed down to resume operations. There are a number of tow boats and barges engaged in the handling of timber on the Mississippi and its tributaries and the movement of logs by water is supplementing the receipts by rail at a time when the latter are, relatively, somewhat small. The mills here are generally pretty well supplied with timber and there is little or no short time on account of lack of raw material.

In connection with the movement of logs, it may be noted that the officials of the Southern Hardwood Traffic Bureau and those of the Missouri & North Arkansas Railroad Company have reached an agreement whereby the rate on logs over that line to Memphis are to be reduced two cents per hundred pounds. The bureau some time ago filed a petition in behalf of the Nickey Brothers Hardwood Lumber Company and the Tschudy Lumber Company with the Interstate Commerce Commission seeking a lower rate on log shipments to this center. The matter now goes to that body on an agreed statement of facts and if the latter is approved the petition itself will be withdrawn and the incident closed.

An Available Supply of Hardwoods

an Philippine, we want to do as the Bereim of Forestry at Manilla of to the region of the Philippine Islands in adde to any of the paper forters of future competition with these

In Philappin Isan's spirit call the only place in the tropics where multiplication is a reason and an adena American methods of loge 2 are retrotate sawnells, and as a result of this these isho is are also to supply builder in commercial quantities.

Approximately one-third of the entire Archipelago is heavily timbered, the estimated stand being 200,000,000,000 board feet, of which 142,000,000,000 belong to the dipterocarp family. This family in the Orient takes the place of the conifers in the temperate zone. There are about 500 different species of Philippine trees which produce lumber. Among these are quite a few cabinet woods which can be procured in commercial quantities. Philippine narra is the same as the Indian and African padouk. Acle is the nearest in color and grain to the American black walnut, but is heavier. It is very similar but lighter in color than the pingkadu

and jambo of Burma and British India, respectively. Tindalo is a very handsome, cross grained heavy wood. The above species are sold from \$75.00 to \$200.00 per thousand board feet on the Manila market. Acle and narra make handsome veneers, both in rotary and slice cut, while tindalo is fit only for slice cutting. These species are now being shipped to Europe and a little to the United States for veneer purposes.

Among the dipterocarps are many woods of excellent qualities. The lauans of the dipterocarp family are comparatively light woods, take a fine finish and stain exceptionally well. The lauans run in

color from creamy white into a deep chocolate red. Selected and clear lauan lumber can be had on the Manila market for \$40.00 per thousand board feet. Red lauan has been sold in the United States as "Philippine mahogany." Tanguile and the lighter colored lauan are exceptionally fine for furniture and have been used in Manila for that purpose for the last ten years. About a million board feet of tanguile have been sent to the Pacific coast within the past year for veneer purposes. Lumbayao, a Philippine wood in the southern islands, is similar to mahogany in color and grain but a trifle coarser in texture. It can be had for about \$45.00 per thousand board feet. When quarter-sawn it has a beautiful ribbon grain. Lumbayao and red lauan when quartered are practically the same as the Sapeli mahogany from Africa, which is sold in Europe. The white lauans also show up a beautiful grain when quarter-sawn. At present the lauans and lumbayao are being used in the islands as construction material, some for interior finish and for form lumber for concrete work. All of the above mentioned species of the dipterocarps can be bought on the local

market for less than \$50,00 per thousand board feet. Guijo, another of the dipterocarps, is being used extensively for heavy construction. The lumber companies use guijo for their log-car bunks. The quartermaster department of the United States Army has been using guijo for bodies in its escort wagons, dump cars, truck wagons, for felloes and spokes in the wheels, and for felloes in its built-up wheels for automobile trucks, in its Manila shops. It is the only wood used extensively for spokes and felloes and shafts by the Philippine carriage and wagon manufacturers. Dungon is used for hub stock and occasionally for spokes and felloes, as is also yacal,

Pick, mattock, shovel and garden tool handles are being made of malugay, replacing the American hickory in the Philippines. The Philippines have several species of diospyros which can be used in

place of the persimmon and dogwood of the United States for shuttles and wooden parts of cotton mill machinery. Quite a few species make excellent carpenter tool handles and mallets. Gunstocks of several varieties of Philippine woods have been made at the Rock Island Arsenal for use in the United States Army and have given, good satisfaction.

The Bureau of Forestry of the Philippine Islands expects to make an extensive exposition of Philippine woods at the Panama-Pacific Exposition in 1915. All of the woods which can be had in commercial quantities will be shown. A bench and tools will be available for visiting fur-

A TYPICAL PHILIPPINE LOGGING SCENE—CUTTING A FINE SPECIMEN OF NARRA. NOTE TYPICAL, HUGE BUTTRESSED TRUNK AND METHOD OF FELLING. HAD A LOG LENGTH OF 33 FEET ABOVE THE BUTTRESS.

niture men to try out the Philippine woods for their own satisfaction. A varnisher will be on hand to demonstrate the finishes the Philippine woods will take.

Being a jolly good fellow should not call for making a monkey out of yourself for the amusement of every fellow that comes

The righteous man who likes to air his own virtue is very likely to spoil it-if he really has any.

When a man says he is getting too old to learn new tricks he generally means that he is getting too firmly set in his ways to depart from them.

If there is a prize for the best showing at those Forest Products Exposition, here's betting that hardwood gets it.

More lumber and finished articles in hardwoods going abroad and fewer logs would make the returns larger without drawing so heavily on our forest resources.

Pertinent Legal Findings

LOSS OF LIEN ON TIMBER

As from of the Oregon statistics cases, "Any person who shall period another to go upon his torced condition thereon sawlogs, spars, (the condition to the price agree) to be paid for such picts, piles, and tanher to the price agree, to be paid for such privilege," etc. Held, that the hence obtenplate, by this provision is wrived as to all logs which the landowner permits to be removed and rafted away, without collecting the price due thereon, or filing any notice of lien. In such circumstances, he will not be permitted to enforce a lien for the price of those logs against other timber to be cut under the same contract. (Oregon Supreme Court, West Shore Lumber Company vs. Hollenbeck, 136 Pacific Reporter 671.)

RIGHT TO LIEN ON PUBLIC BUILDING

One furnishing materials for the construction of a public building, such as a school house, is not entitled to enforce a mechanic's lien to secure payment of the amount due him, unless some statute of the state expressly authorizes a lien. (Oklahoma Supreme Court, Western Terra Cotta Company vs. Board of Education of the City of Shawnee, 136 Pacific Reporter 505.)

ACCEPTANCE OF OFFER TO SELL

Under the general rule of law that there can be no contract of sale unless the seller's offer is unconditionally accepted, or he accepts a condition imposed by the buyer, no contract was formed by an offer to sell a quantity of oak, log run, at \$16, and mill culls at \$8 per 1,000, where the person to whom the offer was made replied that he would take 4/4 oak at \$16 and mill culls at \$4.50, (North Carolina Supreme Court, Morrison vs. Parks, 80 Southeastern Reporter \$5.)

CHECK AS MEDIUM OF PAYMENT

"A bank check is not payment until it is paid, unless the payee accepts it as such; nor does a bank check drawn in the ordinary form operate as an assignment of any part of the fund standing to the credit of the drawer until it has been accepted by the drawer." Hence, where a creditor erased from a check received by him a notation stating that the check was received in full payment of his claim, his mere retention of the check did not prevent a third person who held a claim against him from garnisheeing the original debtor. (Georgia Court of Appeals, Kirby Planing Mill Company vs. Titus, 80 Southeastern Reporter 18.)

REMOVAL OF TIMBER PURCHASED

When a conveyance of standing timber merely limits the time within which the trees may be severed, the purchaser does not lose title to timber cut, but not removed from the land, within that time. (Georgia Supreme Court, Jones vs. Graham, 80 Southeastern Reporter 7.)

DAMAGES FOR DELAY IN DELIVERY

Where a seller of a cargo of lumber notified the buyer that the vessel would be ready for unloading "about" a certain day, but it did not arrive until twelve days later, the buyer is entitled to recover the amount of his damages sustained in direct consequence of the delay. (Florida Supreme Court, Holmes vs. Stearns Lumber & Export Company, 63 Southern Reporter 449.)

LIABILITY FOR LOGGING CONTRACTOR'S NEGLIGENCE

A lumber company, though liable for burning of an adjoining land owner's property through negligence of its employes in permitting fire to escape to the property, is not responsible for any such negligence of independent contractors who have exclusive control of the method of doing their work. (North Carolina Supreme Court, Patrick vs. Giant Lumber Company, 80 Southeastern Reporter 153.)

INJURY TO LANDS IN FLOATING LOGS

A company which maintains a dam in a stream in floating logs is liable for injury to lower lands, inflicted by discharging water in destructive quantities outside the channel of the river. (Min-

nesota Supreme Court, Torgerson vs. Crookston Lumber Company, 144 Northwestern Reporter 454.)

DAMAGES RECOVERABLE FOR SELLER'S BREACH

Where a select of a carboar of bunder undverteath shapped at to the wrong destroat on. Lit the leaves received at there are, reshipped it to the proper destination, without consulting the seller, the buyer is not entitled to recover from the seller the freight charges involved in the reshipment, especially where such expense was in excess of the value of the lumber. (Louisiana Supreme Court, Mercantile Lumber & Supply Company vs. Jones & Pickett, 63 Southern Reporter 501.)

RESPONSIBILITY FOR NEGLIGENCE OF CO-EMPLOYE

Since Kentucky is one of those states in which an employer is not liable for injury to a workman caused by the negligence of a co-employe, unless the latter had superintendence over the injured worker, or unless he was habitually incompetent, so as to charge the employer with negligence in retaining him, the owner of a planing mill is not liable for injury to an operator of an edger, caused by negligence or recklessness of the engineer of the mill. (Kentucky Court of Appeals, Wiltshire's Administratrix vs. Kister, 160 Southwestern Reporter 743.)

The Handle Trade

Last summer turned out to be one of the best that the bulk of the handle manufacturers ever experienced. Handles of all kinds were in excellent demand during the entire summer, and instead of the mills being shut down for a month or so during the warm weather as is usually the case, continuous runs were made. In fact during the fall a great many of the mills were running overtime and had trouble in keeping up with their orders.

According to the version of some of the leaders in the handle trade, one reason for this seems to be that there has not been any more lumber on the market dry enough for use than is necessary to supply the necessary demand, and handle men have not been able to increase their output as much as they would have liked to. In fact, in some localities it is reported that handle factories have been compelled to stop operations entirely because of the fact that they have used up their available lumber supply.

The broom business is in good shape and still continues to take all the output of the numerous broom handle factories. In addition, the vacuum cleaner factories are still running to full capacity. Several of these are turning out an average of 500 machines a week and in addition there is a large number of smaller firms with outputs of smaller proportions. Considering the great number of vacuum cleaners of various kinds being turned out every day, it is surprising that the demand for brooms does not seem to decrease. These vacuum cleaning machines are of interest to other lines of woodwork besides the handle man as all of the hand machines have a framework of wood which is covered with metal.

The rapidly increasing use of bardwood floors has created an extensive market for fine brushes with which to take care of them properly. That there is an unusual demand for brushes of this character is evidenced by the extent to which they are being advertised and the demand for the handles with which they are equipped. These handles are of the finest make and are all finished in the best way possible. They bring a very good price and, where handle factories are equipped to turn them out, constitute a distinct source of revenue.

The coming of rains and colder weather is not only a reminder to mend the roof and look after the heating equipment, but it should also suggest the advisability of putting lumber piles in order, and as much lumber under shelter as practical.

A border of trees along all those great roadways we expect to build will round out the picture about right and help supply the timber needs of the future.

The Foreman and the Understudy

the cay the sawyer, there was observed a little bit of clumsiness and awkward handling of the nigger. It was a good, healthy steam nigger and every once in a while the sawyer would kiek a log clear over the top of the knees. It took pretty lively jumping around on the part of the man on the carriage to save them selves from damage. A word of inquiry developed the fact that the manipulator of the levers at the time was not the regular sawyer but was the mill foremat. It seems that for some cause the sawyer was oil tog that any and the built foreman was filling his place.

While he was making a fairly good try at it, he was not doing as much work or doing it with the same case with which the regular sawyer performed these duties. But just how much the output of the mill was reduced was not learned, but it was evident that the day's run would tally up enough smaller than the average day's run with the sawver in his place to pay the wages of the sawver.

The next day the sawyer was in his place and the mill was going smoothly, cutting more lumber and doing it easier, while the men on the carriage were not kept hopping about like jumping jacks to keep out of the way of logs kicked over the knees. On looking around, however, it was found that the foreman had again converted himself into an understudy and was operating a band resaw. There were two band resaws in the mill, a heavy one that took thick flitches and reduced them to boards and another further along through which some of the boards were run to make thin stock. It was this latter saw that the foreman was running. He was making just as good an effort as in his former job, and was perhaps doing all that was required in fully as competent a manner as the regular re-sawyer.

The incident, however, served to raise several questions that should be of interest to sawmill men and should be studied by them with the hope of working out some logical method of solution. One of these questions is, whether the foreman should be an experienced mechanic and understudy and take the place of different important operators in the mill at times when from cause they are absent. Another question suggests the necessity that every important operator in the mill have an understudy so that in case of the absence of the principal there will be a trained man at hand to fill his place without seriously interfering with the regular progress of the work. Incidentally there is sandwiched in here another question, a question of whether or not the saw filer should keep in training as a sawyer and take the place of the sawyer during his absence.

In many of the big institutions of the industrial world this understudy idea is an important item in the organization. Every man occupying a place of importance that calls for peculiar skill or knowledge has an understudy, so that in case of sickness or absence from any other cause the wheels of industry may go along with practically no interruption. Here the fact is recognized that the health and the goings and comings of men are beset with uncertainty; and that these uncertainties are likely to clog the wheels of industry unless they are bridged over in some way. Thus we have as a part of systematic industrial management the proposition of an understudy for every man whose absence would cause disorder.

Surely something of that kind should be a good thing in the saw-mill where steady running is the rule. It is, of course, very convenient and helps out in many an emergency to have a foreman who is a man of many parts and can replace in a way any operator in the mill at any time. It is doubtful, however, if anything is ever gained in the long run by having the foreman do these things. The foreman's job is to be foreman, and if he attends to his business properly he will have plenty to do around a sawmill of fair size without applying himself to the filling of some man's position. To fill the position of those that are absent really converts the foreman into a sort of universal understudy for all the principal operators in the plant.

There are some positions in the sawmill that certainly should have an understudy. The question is, who should the understudy be and how should it be arranged that the absence of a skilled operator here or there should make but little difference in the plant's operation. The natural order of things, so far as the sawyer is concerned, is to have the block setter and the sawyer and the filer to understudy each other more or less and to be prepared to shift places and replace each other in emergencies.

Some filers contend that their duty does not embrace sawing, and there are perhaps some expert modern filers who would make poor headway at sawing. Where this is true it is perhaps all the more reason why the filer should understudy the sawyer and the sawyer understudy the filer. It would certainly broaden the filer's knowledge of how his saws stand up in operation to spend a half a day or a day now and then using them. Indeed it would do no harm if the filer were so well skilled in sawing that he could inform the average sawyer as to just what kind of log and feed handling were necessary to get the fullest measure of service out of a saw.

The sawyer on the other hand may well study and experiment at filing for the same reason that the filer may practice at sawing—to gain a broader and better knowledge. In the ideal arrangement these two men should be ready and willing to fill each other's place at any time. In a well provided filing room the filer can generally have enough saws ahead all the time to make a day's run if he has no assistant filer to take his place and help put some in order.

In the older times the natural order of progress in sawmilling was from block setter to sawyer and from tail sawyer to block setter. The block setter was always glad to relieve the sawyer because it gave him some training and put him in line for promotion. This idea is old fashioned, but it is a pretty good one to keep alive even today, and it will not hurt to have the block setter take a hand at understudying the sawyer. It would be better ordinarily for either the block setter or the filer to take the place of the sawyer than for the foreman to relinquish his duties and put in a day at the levers.

The instance given above is but an illustration of the disorder which may result when certain men in important positions fail to show up. There are many more, both in the sawmills and in other woodworking plants. There are times when the engineer is sick, and where again the foreman of many parts is often called upon to do the understudy act. It may be a good thing, but it is a wrong idea where the foreman has his own work cut out for him. There should be another understudy for the engineer.

The incidents happening at the sawmill recall some other happenings in a woodworking institution using quite a lot of hardwood. There was a foreman who had come up from the ranks, from a practical machine operator and all-around mechanic. He was an earnest worker and a competent foreman, and a man who had the respect of every man under him and could get the full measure of work out of all of them. But he put in too much of his time at different machines filling the places of absent men and doing work that should have been done by others.

His duty, aside from superintending the plant, which contained about thirty different machines, was to mark off and lay out certain work. When the plant was working full he was not even expected to do this, but employed a special man for layout purposes. Yet he didn't even confine himself to the layout work. He would often relegate it to some machine man who was not particularly busy at the time, and go himself to replace some absent man at a machine where work was piled up. He did this, too, notwithstanding that there were other men in the place at the same time who could have done the same work at the machine better than he could, because they were in better training.

There are foremen who make a success of their foremanship while at the same time understudying many of the important skilled workmen under them. It does not seem, however, to be a good idea as a general proposition, or to belong in the modern scheme of things. It looks as though it would be a better proposition for the foreman to figure out some system of understudies for men in important positions so that in the absence of one a little shifting about will keep things going and leave him free to direct the work and attend to his duties as foreman.

J. C. T.

Some Fallacies of the Forest

ARTICLE THREE

To this day there are people who insist that the spigot for a cider barrel must be made of appleador. There is no telling how old that superstition is, but it goes back to the days when popular education was not general. It was supposed that the cider in flowing through the spigot was improved in some way by contact with the wood of the tree which bore the apples. Some cider makers in remote rural districts yet hold to that view. There is no basis for the belief further than that applewood is good spigot material. It is sanitary because close-grained, hard, and not inclined to check.

A closely-related belief is that vinegar barrels should be equipped with cedar spigots. Rural stores in some parts of the country still announce that they are prepared to sell cider spigots for such of their customers as need them for vinegar barrels. It does not appear that any satisfactory reason is offered for the preference of one wood for the cider barrel and another for the barrel that contains vinegar, as the difference between these two liquids is often a matter of mere age.

The superstition that cedar is a parifier of liquids extended much farther than the vinegar barrel. It was once believed that the southern white cedar, which grows in the swamps near tidewater in New Jersey and southward, exercised a mysterious and beneficial influence over water brought in contact with it. Pails with cedar staves were popular, and many sea-going vessels were equipped with water casks made of this wood.

The belief went still further in regard to that species of cedar. It was declared that the growing trees purified the swamp water in which they stood. Vessels about to leave the Chesapeake bay on long sea-voyages occasionally provided themselves with a bountiful supply of stagnant water from the Dismal Swamp in Virginia, under the firm belief that they were taking worthy precautions by having all the casks filled with drinking water fresh from the swales, lagoons and frogponds of the morasses where the cedars grew thick.

Possibly the resin in the wood affected the water to a small degree, particularly if confined in cedar casks; and it is not improbable that the presence of bark, leaves and berries assisted in precipitating the impurities of swamp water; but the old belief appears to have died out in the region where it was once prevalent.

The traveler through the southern Appalachian region will sometimes find the domestic help about the farm engaged in making the supply of family soap. Lye from ashes, a quantity of grease, and certain other ingredients enter into the manufacture. The mixture is boiled in a large iron kettle, usually out of doors. More likely than not it will be found on examination that the stick used in stirring the soap is sassafras. That is not a case of happen. An inquiry will elicit the information that no other wood will answer as well as sassafras for stirring the soap kettle.

The superstition is widespread, of long standing, and it is still firmly entrenched; but no cause is known why soap is better if stirred with sassafras than with any other wood. A make of "sassafras" soap has long been on the market, and its odor at once betrays it; but the odor is not due to any stirring with a sassafras stick, but to the presence of sassafras oil mixed in liberal quantity during the process of manufacture. The oil is obtained by distilling sassafras roots. It is remarkable how firmly the soap stirrer holds its place among people who would not be usually classed as superstitious.

Similar beliefs, some without any basis of truth whatever, were once very common, but have now largely disappeared because of more general education. One of these will serve as a sample. It was maintained that a branch of dogwood (other woods were mentioned also) would greatly benefit the weak, famished cattle that were "on the lift" in the spring of the year. The term "on the lift" has fortunately passed out of use. It was formerly applied to farm animals so nearly starved that they could not

get up when down, and had to be litted to their feet. That condition was once common in early spring before green things began to grow, and after the dry feed was exhausted. Farmers with small clearings did not always raise enough to tide their stock "through to grass," and a good deal of "lifting" had to be done. It was then that the dogwood superstition came into play. It was claimed that a branch of that wood, fastened to a cow's horns, miraculously increased the poor creature's strength to such an extent that she could get up without being lifted.

It is needless to say that if the farmers of that time had spent a little more time raising todder they need not have placed such implicit faith in the efficacy of the dogwood branch to "lift" the cattle the following spring.

One of the longest survivors of all the fallacies about wood is that which attributes to the moon some potent power over the tree and its products. This superstition assumes various shapes. It was formerly supposed by the majority of country people, and still is by many, that the phases of the earth's luminary influences not only the lasting properties but also the seasoning qualities of wood. Take the case of shingles, as that was one of the most common articles over which the pale beams of the mighty orb were supposed to exercise a benign or malignant influence.

The tree from which shingles were to be made must be cut when the "sign" was right. All farmers understand the "signs" perfectly. There were a great many variations of the "signs" that must be observed, for each kind of timber had a "sign" of its own. The man who was about to split red oak clapboards or shingles for a shed roof watched his almanae, and when the horns of the moon were pointing down he felled his tree. That guaranceed the shingles to lie flat; but if the tree were felled when the moon horns were pointing up, the shingles would be certain to curl up.

Red oak, in common with all other oaks, and with most other hard-woods, warps badly when thin pieces, like shingles, are exposed to dampness on one side and dryness on the other. Since shingles nailed on a roof cannot curl downward, it is evident that they must warp upward if they warp at all. They assumed that position in dry weather, but at the end of a long period of rain they were well soaked and the warping was nearly gone. They lay fairly flat on the roof.

The fact is, the warping of shingles is independent of any phase of the moon; but the old timers would never listen to such a statement. They were as firmly convinced of it as they were of the flat shape of the earth. Every roof with warped shingles that fell under their observation was a clincher, in their opinion, that the timber of which the shingles were made had been felled when the horns of the moon were pointing up. The fact that the same shingles were straight enough in wet weather had no effect on their theory. It is well-known that a superstitious person is almost powerless to learn anything by observation, if it militates against his set notions. Fifty contrary facts weigh less with him than a single fact which he can interpret as proof of his preconceived notions. Thus it was that the pioneer shingle and clapboard makers went on, generation after generation, felling oak timber according to the signs of the moon, merely because their daddies did so before them. A little observation would have shown them that their prejudice was not founded on fact.

They had no such superstition regarding pine shingles, because pine warps little and the shingles always lay flat. When this fact was explained at all it was explained on the assumption that the moon was unable to influence pine as it did oak.

There was a whole category of superstitions regarding the moon's influence upon timber. Some related to decay, others to the attacks of worms and bugs, and some in still other ways. Everything, real or imaginary, that went wrong with timber was saidled on the poor moon.

Housekeeping in the Lumber Yard

We kept that the second addy not unique, though one may except each test. Let \$\sec{v}(r_1) \cdots \

Some lumbermen seem to behave that keeping a yard looking spick and span has nothing whatever to do with the success of the business. Perhaps this is true; if it is, it must be merely a coincidence that the concerns which keep their yards "dressed up" all the time are those which are making the greatest success in the lumber business.

The wholesaler may interpolate a staggestion to the effect that his studden is a good deal marker than that of the sawmill man, because his lumber is constantly moving. It is more "fluid" than that of the manufacturer, who must needs keep his stock on sticks for several months before he attempts to dispose of it. Consequently the piles of the sawmill man are anchored, so to speak, for a considerable period, while those of the jobber, who gets a large part of his stock tairly dry, may be torn down at any time. The jobber who tries to take care of special orders, and who doesn't mind going through his piles to get special sizes, will likely have a rather chaotic looking yard; but this very condition may be the best evidence of success.

Conceding that, however, even the jobber can help the business by 'cleaning up'' after these operations, and seeing that his piles are not demolished more frequently than necessary. Proper piling in the first place, of course, would minimize the amount of handling necessary. When it comes to the sawmill man, however, there is little excuse for not keeping his piles in good order and in making his yard look, as someone expressed it, like a newly-swept kitchen.

One of the best aids to a good yard is good roads. Instead of depending on the earth to remain dry enough to permit the trucks to be moved about freely, the lumberman with foresight builds macadam roads which drain well and which can be used right after a rain without imposing excessive burdens on his teams and men. And such roads certainly improve the looks, just as they increase the efficiency of the yard. Yet many a wholesaler is content to have his men and horses struggle through the mud until it looks like the track at Churchill Downs after a hard day's racing on a rainy day.

Keeping the alleys cleared of material, in the form of piling sticks, odd boards, etc., is another important feature which deserves attention. In the first place, such care prevents the waste of good material, for a board which is allowed to lie out unprotected soon deteriorates. Yet good lumber is often maltreated in this way, and losses pile up which could have been turned into profits by the exercise of a little care. Lumbermen whose yard crews work on the piece basis usually require the replacement of sticks in racks provided for that purpose as part of their work, and having this definitely understood keeps the yards cleared of the sticks and enables them to be used much more than when they are dropped anywhere and allowed to lie after a pile has been taken down.

This means, too, having on hand a sufficient number of sticks for pilling green lumber. It is a fact that at some mills lumber is put up with two few sticks for the proper support of the boards, simply because the crews couldn't find enough at hand. Of course it is easy enough to cut up fresh sticks, but sometimes this means delay. The best way is to make proper use of those which are already in place, so that when a new pile is put up there will be no lack of sticks on which to place the green stock.

An interesting feature of some yards is the use of continuous piling foundations. Instead of building a foundation for each pile, the supports are put down the entire length of the alley. The advantage of this is that the size of the piles may be altered to suit the situation. If the lumberman wants to pile his stock in narrow piles, he can do so, whereas if he desires to use broader stacks his foundations permit him to resort to this plan. It doesn't cost much more to build the foundation in that form, and judging from the resulting convenience, the added investment in material and labor is well worth while.

Another good point, which has been noted in well managed yards, is the use of a number for each pile. The numbers are systematically arranged, odd numbers being on the right of the main alley, for example, and even on the left. When this plan is used, the stock list shows not only the amount of each kind and dimension of lumber on the yard, but also its exact location. It is sometimes annusing to hear a lumberman discussing with his yard foreman the question of how much stock of a certain kind is on hand.

TO THE STATE OF TH

"How about that pile down in the far end of the yard?" the lumberman asks. "Isn't there a lot of No. 2 common quartered oak?"

"Not much," the foreman answers, "We used up part of that pile finishing out a car the other day,"

This rough and ready style of keeping informed about the amount of stock on the yard is entirely eliminated when the piles are numbered and the information thus made available is taken advantage of. As each pile is put up, the office receives a memorandum showing the date of piling, the amount of stock and its description. As lumber is shipped out, the proper notation is made on the tally sheet, so that the stock list can be corrected right up to date without the use of a great deal of labor.

The man whose piles are numbered, and who keeps track of the movement of stock from the mill to the yard and from the yard to the car on this basis, is never in doubt as to how much of any item he has. All that is necessary is to refer to his records. Instead of dashing out into the yard and consulting with his inspectors, he can tell an inquirer about the stock without the loss of a moment. And this readiness in advising as to stock on hand is worth a great deaf from a selling standpoint.

Another advantage which comes from this system is in case of fire. A merchant who had a fire loss and whose books were not in such condition as to enable the value of his stock to be checked up, would have a considerable struggle with the adjusters before he got his money; yet lumbermen frequently go into the adjustment of a fire loss with only an approximate idea of the amount of stock in the yard or in that portion of it which was burned.

"We have our stock list for last month," he can say, "and we know how much we have shipped out since then. We also know the footage which has been put into the yard from the mill. But we can't tell you how much of each item was burned, nor give you more than an approximate estimate of the value of the lumber."

A careful investigation of the situation, calling into conference everybody in the yard who was familiar with the stock, usually results in about the correct figures being arrived at; but certainly this method is not to be desired if it is possible to get the facts by the simple plan of referring to the card index or loose leaf ledger and noting the contents of the piles which were burned. That much can always be ascertained, and after that it is merely a matter of looking at the books in order to ascertain the additional facts that may be desired.

Some lumbermen whose piles are numbered do not go to the trouble of itemizing the daily additions to stock from the mill, catching these figures at the end of each month when the stock is inventoried. Inasmuch as the best practice is to tag each pile at the time it is put up, with the date of piling and the amount and description of the stock, it seems that this information could be made part of the daily record, instead of leaving it to the monthly inventory. When both incoming and outgoing movements are known, the record is absolutely complete, and furnishes advantages too numerous for separatemention.

Sawmill men who are using the plan of numbering their piles, as well as the other ideas suggested in connection with good house-keeping, are enthusiastic over the possibilities of the system. As suggested above, the wholesaler whose stock is on the move all the time would find it difficult to adapt his business to a pile-numbering system; but there is no question about its being a valuable aid to the manufacturer.

G. D. C.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquiriers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of eigh letter and enclosing a self-addressed stamped envelope.

B 632-Varied Requirements in Hardwood

Dos Montes, Le, Jan. 6. Phytor Hydroxyon, Recome. We would appreciate your perfuse a (n, 6, 2) with maintaneousless who could fill the following terms.

1 to 2 cars $1^{\prime\prime}$ No 4 common write ak, also quartered oak same dimensions

4 to 5 cars core stock 1", 1 , 1 1" and 2", preferably in scattern willow, soft impleased buch and northern ash

Quartered white oak in 5/8 and 1" No. I common; Plain white oak in 5/8 firsts and s/conds; Plain white oak in 1" No. I common; White oak smarcs 2.97/3/07, 2/5.21, 50"

Veneers: 1 16 sawed quartered white oak; 1 20 mottled figured mahegany; 1 20 rotary out barel, Lard maple or peptar; 3 16 rotary gum or other words.

Straight grained dimension pieces of eak, ash, hickory, hard maple or birch, clear, sound, straight grained, free from knots, wind sbakes or any other defects that will impair their strength. These pieces 2x2-5′, 2x2-6′ long, 2x2-7′; 50 per cent 5′ long and from 25 to 30 per cent 6′ long.

A and B and better, short leated yellow pine in 1x12:16', 11₄x16:16'; also 4x4, 6x6, 6x8, 8x8, 12', 16' and several cars No. 2 cypress crating.

2 to 3 cars 1x3 to 1x5 plant red oak strips, 1 fact and 2 edges clear, as ordinarily sold to floor manufacturers.

3 to 5 cars elm and clear ash, also bemlock in plank and 6" siding T and 6. Can also use some soft maple, and basswood 1" thick.

3 cars No. 1 common oak klin dried, 1½" and 2" thick.

1 carload clean white oak squares 1-5 8x1-5 8-30". Must not be cut

from old brashy timest as it is for bending purposes. Car. material: as: follows: $10.9 \times 0.2 \times 0.00$, $0.1 \times 1.7 \times 0.17$, 0.1×0.19 , $0.1 \times 1.7 \times 0.19$, 0.1×0.19 , $0.1 \times 1.7 \times 0$

Several cars firsts and seconds hard maple, must be clear from 13_4 " thick x 23_2 " wide, up to 113_4 " wide, miscellaneous lengths.

B 633-Services of Experienced Railroad Man Available

Alpena, Mich., Jan. 5. Editor Harawoon Recome: Owing to the appointment of a receiver for our companes and the uncertainty of their policies, it may be necessary for me to become associated with some other company in the near future. I have been closely identified with every department of the companies, and am now connected with and am a stockholder in them. I have had a training in efficiency and economy of operation that cannot be otherwise but profitable for any other company with whom I might become associated.

I have looked after our timber interests here and in the West. Have had active experience in the mills, offices, lumber and woods departments, the laying out and building of railroads. Have just finished twenty-five miles of main line in this vicinity. My annual average sales of lumber run from \$2.00.000 to \$8.50.000.

The writer of this letter is now associated with one of the biggest operators in the North. He is a man probably second to none in the line in which he has perfected himself, and this should prove an opportunity for someone looking for the right kind of a manager for a northern operation.—EDITOR.

B 634-Wants Elm Strips for Hoops

San Francisco, Jan. 2. Editor Hardwood Recount: One of our customers here has started the manufacture of coffee barrels and requires elm strips in quantities for hoops. These strips will run 3/16x2+x54", 4/"x24/"x61" and 4/"x24/"x70". It is not necessary that these be surfaced. Can you put us in touch with one or more concerns who handle this class of material?

The above inquirer has been supplied with the names of a few manufacturers of elm strips. Anyone interested can have the address on application.—Editor.

\boldsymbol{B} 635—Wants Stained Saps White Pine

New York, N. Y., Dec. 31. Editor Hardwood Record: We are in the market for a car or two of 5.4" stained saps white pine. If you know of any mill having this material we will be glad to have you put us in touch with it.

A limited number of sources of supply have been given this correspondent, but anyone wishing to be placed in touch with this prospective customer is welcome to the address on application.—EDITOR.

B 636-Foreign Concern Wants Hickory Squares

The second of th

The information sought has been supplied, but anyone desiring the source to be an expensively supplied to the contract of the

B 637-Wants No. 1 Common Basswood

A lost of manufacturers of basswood has been supplied this costern house. Anyone interested in the inquiry will be given the extress known andication to B 637. There is

B 638-Wants Two and Three-Ply Veneers for Trunk Work

San Francisco Ca. Der al. Editor Hyntovoen Record. W. world appreciate very much if you will kindly give us the names of large manufacturers of basswood and cottonwood veneers in two and three-ply suitable for trunk work.

The writer of the above letter has been advised that as far as the editors of HARDWOOD RECORD have been able to find out, cottonwood is not glued-up because if the logs are steamed the veneer roughs up in cutting. On the other hand it is impossible to glue up stock made from logs which have not been steamed as the glue will not stick where the natural tree sap is present. The writer has been advised that while he could probably get basswood in this stock he should substitute gum for the cottonwood.—Editor.

B 639-Wants Hazel Lumber

Saginaw, W. S., Mich., Jan. 5 Editor Hardwood Recent: Please advise where we can purchase hazel lumber.

The writer of this letter has been given the names of two or three concerns who might possibly be able to furnish this stock. Any others directly interested can have the name on application.

B 640-Takes Exception to Editorial

The last issue of Hardwood Record contained an article entitled "Scientific Lumber Drying" by Z. Clark Thwing, vice-president and general manager of the Grand Rapids Veneer Works, Grand Rapids, Mich. Hardwood Record published this aricle with editorial comment in which it suggested the possibility that the writer might be in error in some of the points made.

The following is a letter commenting on that editorial, which is published herewith without comment:

Grand Rapids, Mich., Dec. 29.—Editor Hardwood Record: I have been much interested in noting your comments on page 15 of your December 25 issue in the article on kiln-drying.

We feel confident that if you will dig a bit deeper into the results which are accomplished where these other types of klins are in use you will und that their results are far below the modern standard of efficiency.

Particularly in a blower kiln, we are surprised to have you make the comment that you have regarding the control of temperature and hundity. The control of temperature is a fairly easy proposition, but the control of humidity in a blower kiln, or the creation of the necessary amount of humidity for a blower kiln is a problem that has been a tremendously hard one even at normal temperature and in the heating and ventilating of large buildings.

We are, too, very sorry that on the subject of the expansion kiln you did not quite understand us. We admit that the subject is a big one and that we had very little space in which to present what we wanted to along this line, but we certainly give you credit for grasping the facts therein contained.

We agree with you wholly in the lost two paragraphs of your comments and think you are exactly right here. We would like to have brought out these points, but we did not feel that the limitation of the article and the space available would justify us in touching on these points as well as many others of equal importance.

GRAND RAPIDS VENEER WORKS, THOMAS D. PERRY, See'y,

THOMAS D. TERRY, Sec y

B 641-English Shipper Writes Regarding Import Regulations

In the November 25 issue Hardwood Record there appeared an interview with a prominent American exporter, in which he criticised the methods of handling shipments of American hardwoods as applied in the English market. This interview was read by the principal of a prominent firm of wood agents at London who disagrees with the sentiments expressed by the American shipper. This gentleman has written Hardwood Record as follows:

Ly construction I have just sst. dated Nov. in a

trad s. Pederation spent a set and the control of the control of that all American hard to do not be an experienced by the same terms of the control of the c to sales that all American hard to word any discrepances in measure

There is no doubt discrepancies still exist but there is also no doubt that the measure as taken in London is correct ninety-nine times out of

and held cold Chank, or wis age. If it I am fasting in saving so with I say it is not effectively by the held of saving so with I say it is not effectively with nethods in the States I is a little saving of the same independent uncourse; in the employ of the Port of London Authority, whose interest if any is to make the measure as much as possible as all their charges are based on their measurement return. Each board is laid on tressels and measured for length, width and thickness, the width and thickness probably in three places. These particulars are entered separately in a tally book, the want is then in istroicy the the Lutkin rule and contents as shown entered in the book

Now compare this with the sellers' method. They usually measure on the nile the length is guessed in nearly every instance the thickness in every instance and I do not think I am exaggerating when I say that in 90 per cent of the boards the rule is not put absolutely flat on the board. as it would require the measurer to kined down every time, which I certainly does not do.

Another reason that the figures do not agree is because after getting the trade here to use the Lufkin contents rule, the shippers will insist on measuring on a 12 foot basis and thus bring into their invoice every odd two or three inches, for instance, a would 14 feet long, 8 inches widwould be measured here as containing 9 feet super, and 100 of them would contain 900 feet, but on some shipper's invoice it would appear

100 pieces 8 inches = 800 feet; off I 16 total 933 feet. Without admitting the correctness of the statement that there is seldom a shortage when measured in merchants' yards, I could explain some reasons why First of all, the lengths are as in America more or this may happen. less guessed and the wood is measured as tight as possible for selling purposes and without a doubt is not so carefully measured as when done by the Port of London Authority.

Then we come to the question of the 112 per cent shortage. Why should the buyer pay for something he does not receive? I am sure no one in the States buys on such terms. I agree that the shipper rarely hears of any over-plus either on dock or yard measuring. My own opinion is that the two principal reasons why the shortages occur are first; Measuring on a 12 foot basis and second measuring as tight as possible, and if I am right, then it is obvious that these are apparent shortages and only exist on paper.

We now come to the question of thickness and I should first of all like to say that I do not see why the boards cannot be cut to hold full thickness when dry, just as they used to be years ago and are now by some shippers

A board that is 1/16 inch scant in one place might just as well be scant all over, and there is no doubt that at one time many shippers kept all their scant 2 inch lumber for export, knowing that what was noticed would be called 1%" if exported, whereas, at that time it would be called down to 11/2" in their own country.

It is a pity you did not investigate this matter a little further for you would have found that the Timber Trades Federation here gave the matter every consideration, whereas i cannot learn that the counter proposals and reasons for not agreeing to the originals have ever had the attention of the National Lumber Exporters' Association, or at any rate have the points raised on this side been replied to.

No one reading your report would understand that the Federation here had expressed its willingness to submit the following provided the National Lumber Exporters' Association agrees:

National Lumber Exporters' Association agrees:

1. In taking the thickness of all American lumber, same to be taken
1 foot from the thinnest end.
2. In case not more than 2½ per cent in plain oak and 5 per cent in
quartered oak 1°, and thicker, should be 1/16 scant in thickness and 3/4°
and thinner, 1 32' scant in thickness, no notice is to be taken and the
parcel as a whole is to be considered full thickness. If the scant lumber
exceeds these percentages up to 5 per cent in plain cak and 10 per cent
in quartered oak, buyers shall accept the stock with an allowance for all
the scant lumber. If the scant lumber exceeds 5 per cent in plain oak
and 10 per cent in quartered oak, buyers to have the option of rejecting
the whole of the scant lumber. Statisticatory arrangements
the post of the scant lumber are found by the Pert of London Authority to
have the superficial contents marked on each piece in figures such figures
must stand, or alternatively, any pieces with the measurement of which
the Port of London Authority disagree, must be laid aside for inspection.
Shippers to pay necessary expenses.

B 642-Wants Persimmon

Kinghorn, Fife, Scotland, Dec. 11. Editor HARDWOOD RECORD: We are in the market for 100 to 150 tons of persimmon for early 1914 delivery. We shall be glad if you can furnish us with the names of several firms having persimmon logs to offer for early shipment to Glasgow.

The above foreign house has been supplied with a list of manufacturers of persimmon. Anyone desiring the address can have it upon application .-- Editor.

Clubs and Associations

Indiana Lumbermen to Meet

The Indiana Hardwood Lumbermen's Association announces that its tifteenth annual meeting will be held at the Hotel Dennison, Indianapolis, Ind., January 14. Secretary C. H. Kramer issues a cordial invitation to members of the hardwood trade to be in attendance.

Michigan Manufacturers to Meet

Secretary J. C. Knox of the Michigan Hardwood Manufacturers' Association announces that the mid-winter meeting of that organization will be held at the Pontchartrain hotel, Detroit, Mich., on Wednesday, January 21. Statistics will be presented covering a large percentage of the lumber cut for the year 1913 and the estimated figures for 1914, making the meeting of much importance to the manufacturer of lumber. Other subjects to be considered are: Present market conditions; discussion of stock reports covering hardwoods and hemlock and their relation to the present market; experiences of manufacturers under the liability act; togging and camp expenses; report of regular and special committees; torest fire protective matters and Forest Products Exposition.

National Wood Preservers' Association

The National Wood Preservers' Association has issued its regular program for the tenth annual convention, which is to be held at the St. Charles Hotel, New Orleans, January 20, 21, 22. The first session will by on Tuesday. January 20, and will open with the usual addresses of welcome, responses, roll call, officers' addresses, reports, etc. There will be in all foarteen papers covering the many questions directly interesting the members of the association and others interested in wood preservative work. All papers will be prepared and read by experts in their respective times. In addition there will be reports from five standing committees,

The Hardwood Manufacturers' Meeting

The program for the twelfth annual convention of the Hardwood Manufacturers' Association of the United States, which is to be held in Memphis, January 21-22, has practically been completed. It will be unique in the absence of long winded speeches, the whole program being arranged with a view to insuring a meeting full of vital and lively interest to lumbermen.

One of the features will be a discussion of logging problems, the same to be considered from the standpoint of operations in both the hill country and in the low lands. Results of practical experience as to methods and cost will be given, and an open and free discussion is to follow on the floor. There will be several short set talks on logging to open the forum.

The rule of the meeting will be more to encourage discussion to develop features of prime interest to the lumbermen in attendance than to have them chafe under long oratorical efforts. In short, it is to be a lumberman's convention and every mother's son who attends is expected to "talk right out in meeting."

Reports received at the office of Secretary Weller at Cincinnati, indicate that the attendance this year will be very large. The fact that the convention is to be held in the heart of the hardwood producing belt has met with enthusiastic response on the part of the lumbermen and particularly in the Memphis territory, and many new faces will be seen in the hotel lobbies and on the convention floor. The Memphis hotels, particularly the Memphis Hotel Company, which controls the Gayoso and the Chisca, are arranging to take care of all visitors. The headquarters of the association and the sessions of the convention will be held at the Garoso

The Vemplis lumbermen are working hard to boost the attendance and particularly among the consumers, special invitations being enclosed in all the mail that is going out of lumber offices at Memphis. M. B. Cooper of the Three States Lumber Company and Ralph May of May Brothers of Memphis are the two resident members of the committee in Memphis. and they are doing yoeman service. The other members of the committee on arrangements are R. M. Carrier of the Carrier Lumber & Manufacturing Company, Sardis, Miss., who is chairman, and J. F. McIntyre of J. F. McIntyre & Sons, Pine Bluff, Ark. The Lumbermen's Club of Memphis has adopted a resolution welcoming the convention and the individual members of the club are working hard to make a success of the meeting. The lumber industry in Arkansas will be represented by practically every hardwood producer in the state, which is likewise true of Mississippi, Louisiana and Texas.

Convention of Ohio Association of Retail Lumber Dealers

On February 3, 4 and 5 the Ohio Association of Retail Lumber Dealers will hold its annual convention at the Hotel Gibson, Cincinnati, O.

Work on the new hotel where the convention will be held is nearing completion and all doubts as to its readiness are removed. The convention is expected to be one of the largest ever held by the association. About 1.000 visitors are expected.

The Lumbermen's Club will have full charge of the registration as well as the entertainment features, and the entertainment committee will spare neither pains nor money to make the visitors welcome and long remember their visit to the Queen City.

Some Things Worth Knowing Regarding Next Meeting Place National Wholesalers

Memoris of the Buffalo trade extanct the respectation of the honor of cutertaining the next convention of 0. Notional Wholesare Lumber Deaders' Association, and also the restrict the total ness by assuing an extansive description of the many polaries $\{1,2,3\}$, the total encountered in Buffalband the many advantages the city offers as a convention city.

This booklet says that Buffalo is forty two square miles in area; the population, 106,000; the value of exports in 1912 was 860,705,000 and funder receipts at that year w \$128,674,000. Prg group production, 1.720,000 tors. In 1912, 3.825 years and from Buffalo and 3.750 vessels arrived. There were 8.925 tons of coal shipped via lake during that year.

The city has most excellent police and school systems, having one new technical high school under construction which will cost \$2,000,000.

Seventeen railroads enter the city with 250 passenger trains daily and the city trackage is 700 miles. The Niagara tunnels are within twenty miles from Buffalo and power is delivered in Buffalo at one-third less than cost of horse power from the streams in unlimited quantities.

The Lackawanna Steel Company, the largest and most complete individual plant in the world is located at Buffato. This company has \$60,000,000 capital. It has a separate breakwater a mile long and a capacious private harbor.

Features worth seeing are: Buffalo University, the stock yards, the second largest in the world; parks, they being six in number; the Buffalo Historical Society; Buffalo Society of Natural Sciences, and the Buffalo Func Art Academy.

In addition, Buffalo has the largest automobile club in the world and also has located at Carence, N Y, seventen miles out, one of the linest country club houses that can be found anywhere. M. M. Wall, trustee of the National Wholesalers' association has been elected president of the country club for the second time, so that, weather permitting, those in attendance will be well entertained.

Northern Graders Hold Meetings

Secretary R. S. Kelberg of the Northern Hembock and Hardwood Manufacturers' Association, Wausau, Wis, has issued the dates and places of meetings of the various gatherings of yard foremen and graders of members of that association. The first meeting was January 6 at Green Bar, Wis, at the Beaumont Hotel. The second meeting was held at the Milliman Hotel, Iron Mountain, Mich., on Wednesday, January 7. The Galloway Hotel, Eau Claire, will be the location for the fourth meeting, January 9, while the last meeting will take place at Wausau, Wis., January 10.

These meetings are for the purpose of promoting better understanding of methods and care of grading stock.

The importance of these gatherings is easily appreciated.

Philadelphia Exchange in New Year's Reunion

The Philadelphia Lumbermen's Exchange held its annual reunion. always a function of high good cheer and jolly camaraderic, as usual, on the last day of the old year. The attendance of members and friends was At 12 M. sharp an elaborate luncheon was served in Griffith Hall, after which a mental regalement followed in the shape of a highclass vaudeville show. Professor Philip J. Pollitz headed the program with some soul-stirring marches, after which the trio-Cripts, Eva and Penn-did some fine entertaining in the way of dancing and singing. Fred Duprey, a favorite comedian, followed with his side-splitting acting and story telling, and after him, as a reversal of entertainment, "Leonardo," a young harpist, filled the air with the sweetest of old and familiar melodies. Joe Field, a well-known personator and humorist, followed and. as usual, delighted his audience with his wonderful imitation of wellknown characters. This closed an all-round enjoyable celebration of the passing of the old year, and the prospect of many renewals gave cheer to the parting that followed. The success of the entertainment is due to George A. Howes, chairman, George Rodemen, Paul P. Pearson, J. Edward Smith and W. H. Wyatt of the office and entertainment committee.

Cincinnati Club Holds Monthly Meeting

At the last monthly meeting of the Lumbermen's Club of Cincinnati the entertainment committee was requested to prepare a special entertainment for the January meeting, and those members of the club who attended that meeting were highly entertained. The meeting was held on January 5 at the unique "German village," which was especially built for stag parties of this kind by the Wiedemann Brewing Company of Newport, Ky., just across the river. Sixty-five members sat down at 6:30 p.m. to a delicious beefsteak and pitch potato dinner. The feature of the entertainment was a cabaret show which continued during the dinner and was received with hearty encore after each turn.

Immediately after dinner President Hagemeyer called the meeting to order. Secretary Bolser read the minutes of the previous meeting, following which several communications were read and disposed of.

On account of removal from the city to the plant at Conasauga, Tenn., of the Conasauga Lumber Company's general offices, the resignation of the firm was accepted with regrets.

The Midland Lumber Company was rejustated to membership, it having temporarily dropped out.

An invitation from the Indiana Lumbermen's Association to its conven-

tion to be held on January 14 at Indianapolis, Ind. was received, and many members signified their intention of attending.

The square deal policy of the club was again very much in evidence one case between two firms was settled at this meeting and another referred to a special committee for decision, after which the meeting advantaged.

Hemlock and Hardwood Operations

Figures showing the cut and shipments of lumber by the Northern Hemlock and Hardwood Manufacturers' Association in 1913 have been sent out by R. S. K. Deeg, sorretney as follows:

out by R. S. Kellogg, secretary, as follows:		
Wood,	Feet Cut.	Feet Shipped
Hembo k	146.512.000	444,762 000
\-l ₁	7 00% 000	7.570.000
Basswood	47,954,000	50.707,000
Birch	\$5,950,000	97,936,000
13Im	26 491,000	28,872,000
Maple	82.744,000	83,695,000
Oals	1.205,000	3.658.000
Mixed (dwo-d	8 1 4 18 0000	32 874,000
Total hardwoods	336,872,000	305,655,000

Nearly the entire excess of cut over shipments occurs in the mixed hardwoods. In fact, except a slight excess in the case of hemlock, none is shown elsewhere. The accumulation of steck amounts to about four percent of the cut.

Annual Meeting of Southern Hardwood Traffic Bureau

The Southern Hardwood Traffic Bureau held its annual election are Memphis on January 6, at which the old officers and directors were chosen for another year. The officers are as follows: President, George D. Burgess, Russe & Burgess, Inc.; first vice-president, Walker Wellford, Chicasaw Cooperage Company; second vice-president, C. D. Hendrickson, C. D. Hendrickson Lumber Company; secretary-manager, J. H. Townshend, all of Memphis, John W. McClure of the Beilgrade Lumber Company, Memphis, is treasurer of the bureau and will serve during 1914.

On January 7 the regular business sessions were held with about seventy-five in attendance. A pleasing luncheon was served at the meeting place, the Hotel Chisca. Reports were read by president Burgess, treasurer McClure and Manager Townshend.

President Burgess said fourteen complaints had been filed with the Interstate Commerce Commission up to January 1, that seven had been heard and six decided favorably. The Memphis-New Orleans case was the only one lost, although this decision was partially successful as the railroads advanced Mississippi rates to New Orleans while the commission declined to permit the advance to stand. He prophesied that the reduction of present rates would be effected within the year.

Commenting on discrimination in ocean rates, he said that investigation disclosed rank discrimination against Memphis in export rates and that a reduction had been asked to Galveston which, if granted, will open up a new port to the Memphis territory. Commenting on proposed five per cent advance in general freight rates, president Burgess stated that the matter should not be allowed to pass without the lumber trade offering all possible information to the Interstate Commerce Commission.

He then reviewed the value of close association work, told of the purpose and accomplishments of the traffic bureau and its benefits and in conclusion thanked the bureau of governors for their support.

Report of treasurer McClure showed that the finances of the association are in healthy condition.

Manager Townshend expressed bimself as pleased with results accomplished during the short space of one year past. He stated that in the Canadian rate case a saving of from five to twenty dollars per car had been effected as a result of the bureau's work.

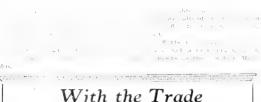

He touched upon the New Orleans rate case and then told of the plan on which the bureau is working for assorting and manufacturing arrangements to make it possible to ship hardwood lumber into Memphis, have it assorted, graded and dressed and within twelve months re-shipped at the through rate in effect from the point of origin to point of destination plus three dollars per car. He said that other cities already have this arrangement and that it would be of vast importance to Memphis to secure it also.

He said that by insisting upon the rule that where tariffs conflict the lower prevails, the bureau had saved members approximately \$10,000 on lumber shipped to Colorado points. Regarding grades, Mr. Townshend said that \$13,700 out of \$20,800 had been collected.

Regarding the weighing matter, the report showed that while much had been promised, little had been actually accomplished by the railroads but that the bureau was still pushing the subject and the Interstate Commerce Commission is conducting its investigation. Mr. Townshend said he believed that regulations would be put into effect during the next year that would be backed by laws to compel the railroads to correct many evils that have been detrimental to the interests of shippers.

The bureau was seeking extension of time for filing of claims under the standard bill of lading and it is expected that this petition will be granted within the year.

Transit arrangements were also secured by the bureau by which logs can be shipped in and lumber shipped out without regard to the character of either. This arrangement is effective with all the roads except the

Milne Lumber & Manufacturing Company Organizes

A. N. Marie, e. a. a. v. et de Marie Brethers Company and the Marie S v. z. T. n. e. r. crapadi. New Yan, authorities that he recently severed his connection with those concerns and is now operating with offices at 46 % Grand Central Terrainal, New York City, as the Milne Lumo r & Manufacturing Company. This concern has excellent milling connections and expects to handle only high-grade stock. Its specialties are kilndried hardwoods, boxing and crating lumber, although all lines of hardwoods are handled and in addition white pine. North Carolina pine and

A. N. Milne was connected with the Milne Brothers Company for two years and before that was with another large wholesale lumber house in

New York, having for about eight years acted as general sales manager. During this period of close association with the consuming trade he has built up an extensive clientele and it is confidently expected that he will carry a good share of this to the new concern.

P. M. Hall, who has been connected with the National Association of Manufacturers, will also be associated with the new firm

Will Handle Pacific Coast Products in East

The latest development in line with the forthcoming opening of the Panama canal is the announcement of a new exporation with large means being organized by prominent lum ber interests in New York City and up state. This new organization is to be known as the Arnold-Mitchell Company, and interested in the project are Arnold & Co., Albany, represented by B. W. Arnold, and White, Gratwick & Mit chell, North Tonawanda, and allied interests in New York City, Philadelphia and Buffalo, White, Gratwick & Mitchell are represented in the above named markets by the Stevens-Eaton Company, the Brown-Bates Company and the Hendricks-Caskey Company. This wide range of activity makes the new corporation specially qualified to handle intelligently a complete stock of Pacific coast lumber to the eastern trade. It represents a selling force second to none while the manufacturing or lumbering end will be in hands of experienced and practical lumbermen.

Personnel Dickson Planing Mill Company Changes

The Dickson Planing Mill Company, Dickson, Tenn., announces that at a recent meeting of the directors, II. T. Cowan and L. II. Rogers were elected president and secretary respectively. Mr. Cowan is president of the H. T. Cowan Lumber Company and makes a valuable acquisition to the planing mill company.

The Dickson Planing Mill Company expects to expand and improve its capacity to take care of its rapidly increasing business in oak flooring, which product has found and is still finding favor with the consuming

The active management will now be in the hands of Messrs. Cowan and Rogers, who will be assisted by W. R. Boit and D. S. Hutchison,

Notice to Creditors of Cincinnati Bankrupt

Charles T. Greve, referee in bankruptcy, announces that there will be a meeting of the creditors of the bankrupt Maley, Thompson & Moffett Company, Cincinnati, at the offices of the referee, 22 Carew building, Cincinnati, on January 13 at 3:30 P. M. The meeting is to be held for the purpose of settling disputed claims and all compromises for disputed claims in favor or against the estate and all matters heretofore not disnosed of

The Benn Lumber Company Incorporated

The Benn Lumber Company is the style of a new addition to the Cincinnati trade, this company being recently incorporated and composed of Ben. Rubenstein, president; E. O. Robinson, vice-president; F. W. Mowbray, secretary and treasurer. E. O. Robinson and F. W. Mowbray are members of the Mowbray & Robinson Company, Cincinnati. Mr. Rubenstein is from London, Eng., and has represented the Great Eastern Timber Company, London, in the States for quite a number of years,

the new concern will deal in hardwood lumber, the bulk of which will

A. V. Jackson & Co. Change Style

A. V. Jacksot & Co., 9 West Fourth street, Cincinnati, O., announce that the style of that firm has been changed to the A. V. Jackson Trustee Company The insertion of the term "trustee" in the official title does not change in any way the methods of transacting the business or the personnel of the organization, but is for the purpose of suggesting more concisely the arrangement and connection with the milling companies whose lumber that concern markets. The company has been operating under the unique plan of acting as trustee of stocks of mill concerns, and

Conasauga Lumber Company Moves Headquarters

Consisted Lumber Company of Cincinnati, O., has removed its general offices, which have been maintained here for the past three years, to the millsite at Conasauga, Tenn., where it was formerly located, company practically controls the Cumberland Valley Lumber Company of this city, and John Byrns, who acted as secretary and treasurer of the Conasauga Lumber Company and who had charge of the office, has resigned in that capacity but retains his interest therein and is associated with his brother, M. J. Byrns, as treasurer of the Cumberland Valley Lumber Company. The latter company will handle a large portion of the output of the Conasauga Lumber Company.

Prominent Eastern Wholesaler Dies

Wil har Vogastis Crombie, dean of the New York wholesale lumber trade, died in that city January 3, after a

short illness. He was in his seventieth year. William A. Crombie was born in New Boston, N. H., in 1844, and his early business career was spent in the Burlington, Vt., lumber tradewhich has furnished some of the best known

lumbermen of the Metropolitan district. He came to New York in 1892 and continued in the wholesale lumber business. He was active in W. M. Crombie & Co., with headquarters at 81 New street. Mr. Crombie was a man of engaging person-

ality and retinement, and the highest type of business man. He had a large circle of friends in business and social life who will mourn his loss. In politics he was a Republican and was that party's leader in the old Fifteenth assembly district. For many years he was a member of the county committee. He was twice mayor of Burlington.

Mr. Crombie was a member of the New York Lumber Trade Association, the National Wholesale Lumber Dealers' Association, and the Merchants' Association of New York. He was also a member of the Union League Club, New England Society, Lake Champlain Society, Empire State Society, Sons of the American Revolution, and Society of Mechanics and Tradesmen.

He is survived by one daughter and two sons. William Murray and Arthur Choate, both of whom are active in the business.

The funeral services were held at the Church of the Divine Paternity, this city, January 5, and a large number of lumbermen were in attendance. Interment was at Burlington.

The Elkmont Contracting and Supply Company has recently installed at Elkmont, Tenn., in the Great Smoky Mountains, a new overhead cableway skidder which breaks all records for distance.

The main cable stretches from the peak of the boom on a self-contained portable skidder, to the top of a hill 3570 feet distant, without any intervening support. Over this lengthy span they are skidding hardwood logs running four to the thousand feet without trouble or delay, having a daily capacity of about 30,000 feet according to the report of the erection engineer, Mr. Blair, who has just returned from Elkmont.

The machine is of the type of the Clyde overhead cableway skidder, but is mounted upon steel skids instead of upon trucks. It has also a powerful extra drum for moving the machine, which is effected by making fast the moving cable to suitable anchorage ahead of the skidder and throwing in the clutch connecting this drum with the engine. In this way the machine is dragged up to an elevation sufficient to make possible these immense spans.

The main cable is 1 14" and is giving perfect satisfaction.

At present the skidder is working from one end of a valley known as Coon Hollow, being located on an elevation at one end of the hollow, while the cable extends down the hollow to the opposite mountainside nearly a mile away. Logs are being skidded from both banks of the

Six guys are used, all being of 1" cable, two of which are wound on steam-driven drums and run from the peak of the boom back to the rear of the machine. Another guy runs out directly in front of the machine,

out of the way.

Coal is stated to the runs through the buggy on the main cable) being lowered down into the valley where the buckets of field are made fast to it, raised and skidded in direct to the machine.

The entire machine is a marvel of efficiency and simplicity.

Unfortunately the mists were so heavy in the valley during our reporter's visit that we were unable to obtain any photographs of the machine in action.

Those interested can doubtless obtain them together with any further intermation ϑ sheed from $\exists \ \varepsilon = 0, \ \exists \ \varepsilon \in \mathbb{N}$ the Clyde Iren Weeks of Duluth

A Giant Cottonwood Log

In this connection is shown a rather smooth photograph of a certain wood log which was recently cut on the lands of the Baker Lumber Company, Turrell, Ark. The section shown is the burt log which measured 7½ feet in diameter at the base. The tree cut 8,000 feet of lumber. The logs were so large that they had to be spear in order that they could be saved on the carriage.

MONSTER COTTONWOOD, CUT BY THE BAKER LUMBER COMPANY, TURRELL, ARK

Louisville in the Veneer Business

Louisville and its Indiana suburb, New Albany, constitute one of the largest and most important manufacturing centers of the country in the veneer and glued-up stock business. Including two plants which manufacture thin stock for package purposes, the Falls of the Ohio boast twelve plants which are devoted to this industry.

The greater number of concerns in the business manufacture highgrade stock for use in the furniture and allied lines. Mahogany, figured elm, Circassian walnut and other fancy woods are cut up, in addition to oak and poplar, and the total production of these veneers, including the tops and panels which are turned out, is probably greater than anywhere else in the central part of the United States.

The Louisville Veneer Mills is the oldest concern in the market, and makes a larger variety of stock than any other. It operates a bandmill for the manufacture of its own flitches, as well as lumber; and has two veneer saws, two rotary machines and two slicers. In addition it has a full equipment of woodworking machinery for the manufacture of glued-up stock, making a full line of high-grade tops and panels. It has built up a reputation for the manufacture of figured gum veneers and panels.

The Kentucky Veneer Works confines itself to the manufacture of thin stock, and operates a veneer saw and a rotary machine. It makes oak principally, though it produces also a large amount of gum stock, both in rotary and sawed stock, as well as poplar cross-banding.

The C. C. Mengel & Bro. Company operates, in connection with its big mahogany plant in Louisville, a veneer saw and a slicer, carrying in its warehouse there an immense stock of veneers. Sliced stock predominates, though its saw is kept busy a large part of the time.

The Anderson Veneer & Sawmill Company is another member of the field which makes sawed stock, operating two veneer saws in addition to a bandmill. It specializes in oak, and makes its own flitches for the most part.

The Southern Veneer Manufacturing Company makes a full line of thin stock, including sawed, sliced and rotary veneers.

The Louisville Box & Basket Company is now rebuilding its plant, which was burned some time ago. It makes thin stock for the package trade, and produces its material on rotary machines. The New Albany

Box & Bost a corporate on the Indiana side of the river, in associated

The Wood Mes no Company of New Albany is now completing the re-

several months ago. It will operate three veneer saws and will make oak parte pally, it not exclusively.

Roberts & Contor of Vew Albany have a large equipment and many inclure thin stock of all descriptions. In addition to a bandmill, the company has a vener saw, a slicer and a rotary machine, and is thus in a position to supply any kind of stock for which the consumer may be in the market.

The H. E. Heinberger Lunder & Veneer Company, which is a successor of the Heinberger & Drinkard Veneer Mills of New Albany commes its attention in the veneer neld to sliced stock. It also operates a bandmill where it cuts out its one fittings.

The New Albany Veneering Company, which is generally credited with having me of the largest and best-equipped panel plants in the entire country, makes no veneers, but devotes its attention to the manufacture of gated up stock. It makes a full line of rable tops and panels, oak, malacents and Creassian waturn before its header.

The Indiana Panel Company is another veteran concern of New Albany which caters to the ecbinet-working trades, and manufactures guied-up steck in great variety, making no veneers.

I from to slave a fit and where as to great the energy for volume of production and variety of goods put out. Louisville and New Albany form a condination which would be hard to beat anywhere less in the color.

Baltimore Building Figures Encouraging

Somewhat contrary to expectations, the yearly report of Building Inspector Stubbs of Baltimore shows more construction work to have been done during the past year than in 1912. The gain amounted to not less than \$1,500,000 in round numbers, proving that the local trade was better than had been supposed or might be inferred from the statements of lumbermen who found that they were not making profits. In a general way the trade has not been remunerative, the competition among the local yards for orders having been so keen that margins were frequently sacrificed for the sake of getting contracts. This was illustrated not long ago when bids were invited for a piece of work that called for a million or more feet of lumber. Some of the largest and most enterprising firms in the city declined to bid on the order, for the reason that they knew it would be taken so low as to leave nothing in it for the man who got the contract. It has happened frequently that the local yards have taken orders for liberal quantities of lumber at prices which could not net them anything like a fair profit. In addition, the successful bidders assumed considerable financial risk. Some members of the trade have come to the sensible conclusion that they had rather not get the business than take it under such conditions. They have determined that the time has come to stop doing business for the mere love of doing it. In the year 1912 not less than 53,079 permits were issued for new buildings, set of the impression is said \$14.17 of \$1.30 of \$1.41 of \$1.40 of

Car Statistics

The 11st bulletin on car surpluses and shortages issued by the American Railway Association gives further evidence of the slackening of trade during December.

On December 15 the total surplus of cars was 107,512 as against 67,466 on December 1; 50,659 (ars on December 31 and 190,521 cars on January 1, 1914. The surplus December 14, 1912, was 26,614.

On the other hand the shortage on December 15, 1913 was 5.968 as against 10,212 on December 1, 33,601 cars, December 31 and 1,671 cars on January 1, 1914. The shortage on December 14, 1912, was 61,006.

Wood-Using Industries of New York

The New York State College of Forestry has sent out advance notices of the publication of a report on the wood-using industries of that state. The annual use of wood for the year covered by the report amounted to 1,750,000,000 feet, which is surpassed in quantity only by Illinois among the states, as far as available statisties show.

This is only the wood which is manufactured into finished products, and does not include that used in its rough form. The report was compiled through the cooperative work of the College of Forestry at Syracuse and the United States Forest Service. The field work included visits to many factories in the state where commodities are made in sizes and of kinds ranging from the toothpick and the shoepeg to the railway car and the ship.

New York spends about \$55,000,000 for wood every year and only thirty-one per cent of this amount is paid for wood produced within the borders of the state. With a vast area of from 12,000,000 to 14,000,000 acres out of a total of 33,000,000 acres better suited to forest crops than to anything else it is claimed that the state will produce practically all of the lumber and other forest products needed when it practices forestry on these forest lands.

Surprising quantities of wood are being used in such unusual articles as wooden shoes, wood fibre plaster, toys, novelties, spools, all sorts of handles, etc. One of the attractive things brought out by the report is that slabs and waste material formerly burned up or left to rot in the woods are being used in many effective ways such as making of toys and other small articles and acid and other chemical products.

University of Wisconsin to Open Ranger Course

The University of Wisconsin announces that a forest ranger course has been inaugurated beginning January 5, 1914. The course will be under the direction of A. M. Cook, formerly connected with the United States Forest Service as supervisor of the Arapahoe National Forest, Colorado.

The faculty of the school will be Charles R. Van Heiss, president of the university; A. H. Russell, director of the department of agriculture: E. M. Griffith, state forester; A. C. Burrill, fish and game; L. R. Jones, in charge of plant pathology; Abby L. Marlatt, in charge of home economics: F. M. White, in charge of agricultural engineering; J. C. Saunders, in charge of economic entomology and nursery inspection: A. R. White, in charge of soils; F. G. Wilson, in charge of field surveying.

The reason the university has established the course is for the purpose of offering elementary courses in forestry, and also to give the course to long and short term students in the study of woodlots, and especially in the care of timber woodlots.

A New Swage Shaper

A new swage shaper for band, gang, and circular saws has recently been put on the market. The engraving herewith shows an outline of the shaper, and the new and important features are briefly described as indicated by letters.

The base (Λ) is made of the best machine steel and is so designed as to furnish the greatest strength and durability, and is guaranteed not to break.

The tooth gauge holder (L) straddles the saw and holds the tooth stop exactly contral over the swaged point. It is mounted on a cross slide which permits the tooth stop to free itself from the stationary jaw as soon as the cramping screw is released, thus furnishing the same advantage as a right and loft hand screw, and assures a uniform movement of both dies against the tooth, and entirely overcoming the objectionable features of the stationary jaw.

The tooth gauge is made in two parts. The upper part (H) lies flat on the back of the swaged point and acts as an anvil; the lower part (t) is a strength bar, the end of which may be filed or ground to meet the size of swage die, and clear the extreme point and also gauge the tooth from the root of the swaged portion, at the same time it prevents the destruction of the swaged point in shaping.

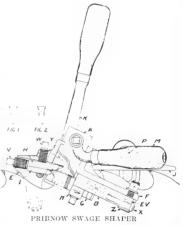

The tooth gauge can be instantly removed or replaced for inspection and refitting by slightly loosening the set serew (W) and opening the clamp serew a full turn, then the tooth gauge will drop out, between the laws on the under side of the shaper. It can be replaced in like manner. The clamping serew has a quick acting double thread and works on the extreme end of shaping law. This furnishes the greatest power at the remained point and with the least friction.

The back rest (J) rests on two teeth and can be instantly adjusted for either band or circular saw, and the shaper set at such an angle that part (H) of tooth gauge fits the various angles of tooth points berfeetly.

The shaper is so balanced that the tooth stop comes in contact with one tooth at a time only, which makes it very convenient to shape short or damaged teeth.

The shapine Jaws are fitted with a double lever working point, as shown at (c) for the maintenance of which a grinding gig is furnished with each shaper. Figure 1 shows the front view of a shaped point and Figure 2 the back view.

The extreme cutting point has a
greater taper and
the intermediate section has a lesser
taper at the angle
the shaper is adjusted on the saw. The
swaged point is tapered downward and
backward. leaving
the cutting edge the
wider. The extreme
point does the cutting, while the interting, while the inter-

mediate section clears the kerf for the tooth to follow, also giving a stronger support for the cutting corner. It stiffens the point and prepares the stock for resawing, which is otherwise wasted in grinding or dressing the teeth to maintain the desired shape.

This swage is known as the Pribnow swage shaper and E. C. Atkins & Co., Inc., Indianapolis, Ind., are sole sales agents.

Two Thousand Trees to Trade

The giant sequoias of California, commonly known as "big trees," are now all fairly safe from the lumberman's ax except one grove which is said to contain 2,000 large trees, some of them twenty feet in diameter. These are privately owned, and the owner is converting them into lumber and waste as fast as possible. A sawmill is at work in their midst, and unless measures of relief are prompt, there will be nothing to save. This is the most southern of the groves of this species.

The United States Forest Service has offered to trade an equal quantity of sugar pine, white fir, yellow pine, and incense cedar for the sequoias, and popular sentiment is exerting itself to induce the owner to accept the offer. The prospect is good that the trade will be made and the venerable trees saved. They are no more valuable for lumber than are the pines around them; but their sentimental value is beyond measure. Some of the trees of that grove already felled for lumber were from 2,000 to 3,000 years old; and doubtless some of those remaining are of equal age. It is earnestly to be wished that satisfactory arrangements will be made to set them aside for the enjoyment of people for generations to come.

A Band Cut-off Saw

The band cut-off machine, designed by Butterworth & Lowe of Grand Rapids, Mich., is intended for cutting logs and timbers into short lengths for shingles, stares, heading, tubs, pails, vener and basket stock, wood pulp and cord wood. Its chief advantages over the old style cut-offs are that it does not require any special foundation, as is the case with the stroke drag saw. It can be bolted down to an ordinary floor, or to a boat or skids, if to be used in the woods. It can be driven with from

one-fourth to enchalf the power \mathbb{R}^2 od by other machines. It is claimed that it does more and better work, and with much less waste than other styles.

It should not require any argument to prove to a practical man that a thin band saw, travelling at high to ad, and an one direction only will cut much more rapidly than a heavy circular or stroke drag saw, requiring but a fraction of the power, and do better work, make niers smoother cuts, with much less waste. According to users' reports it does equally good work in hard and soft woods. It has been in general use for upwards of ten years, giving excellent satisfaction.

It is said that the larger sawmill people have been prejudiced against this band cut-off machine because it is a very light machine as compared with the general run of sawmill machinery, thus giving them the idea that it would be expensive to keep up and possibly impractical. While it is true that the machine is of light construction the same comparison might be made between it and the heavy drag and circular saws as between the old fashioned bicycle weighing fifty to one hundred pounds, and that of the modern machine weighing twenty pounds. While the latter would not stand the same abuse, it will take its rider three or four times as far in a given time and require much less power to accomplish this. There was undoubtedly a strong prejudice against the band sawmill when first put on the market and yet today practically all up-to

. AN EXCELLENT BAND CUT-OFF SAW MADE BY BUTTERWORTH & LOWE, GRAND RAPIDS, MICH.

date sawmills are equipped with band sawmills, and the superiority of the band cut-off machine over the old style cut-offs is claimed to be much greater than that of the band sawmill over the old style circular mill.

There was once much prejudice against band saws run on a quarter twist, and not without reason; but the prejudice has been overcome by numerous examples of successful operation of such saw. Hardwood operators are the users of a large percentage of these saws. They are found in veneer, package and basket plants. The manufacturers have on file numerous testimonials from users, many of them claiming a capacity double or treble that of old-style drag saws and circulars, and that the upkeep is very small in comparison with the kind and quantity of work done.

The Development of Forestry

According to a card recently issued by the New York State College of Forestry, forestry in the United States was first in evidence in 1876 when a forest agency was established in the Department of Agriculture. For the first decade or two, owing to limited funds and lack of public sentiment, little apparent progress was made, but a strong foundation was being laid. In 1891 lands were withdrawn from the national domain to be used as forest reserves, and this policy has been followed by the succeeding presidents and at this time there are 190,000,000 acres within the national forests, having a cash value of \$2,000,000,000. This enormous resource owned by the people of the United States is being administered by the Forest Service with the idea of the freest possible use. Illustrative of the truth of this policy, in 1912 the national forests supplied fuel, fencing, etc., to 40,000 residents, while timber sales amounted to

81,600,000. Forty five thousand owners operated claims within the national forests. Cities and towns numbering 1,175 and 324 water power and irrigation projects got their water from strems arising in the national forests. Sheep and cattle to the extent of one sixth of the meat supply of the United States graze within the boundaries of the national forests and 600,000 people use the national forests as a recreation ground. This is surely direct evidence controverting the statements emanating from those opposed to the national forest scheme to the effect that such forests the up vast tracts of timber and grazing grounds.

Jerusalem's Timber Trade

Jensalem and "the mountains round about Jerusalem" have a small, interesting timber trade, although the largest piece of "timber" sold seldom excessis in size a paper kmre, jewel box, or a cup or goldet. Most of trees are classed in trade reports as curios and religious souvenrs. The number of tourists who visit derusalem is surprisingly small, considering the fame of the city. The number last year was 4.895. Most of these tourists carry away souvenirs with them, and two materials pre-ail mother of pearl and obve wood. Last year religious souvenirs were sold to the value of \$107.063. Those purchased in Jerusalem and errified away in the bargage of teorists were not counted.

Sometimes the Jerusalem olive wood is a subject of inquiry as to exact species. Most of it is doubtless the genuine article cut from old orehards of Palestine, but the claim has been made that some of it grows in Florida, although the direct proof appears to be lacking. The claim is founded on a report circulated some years ago that contractors were buring the trutks of orange trees in Florida, which were killed by the severe freeze nineteen years ago, and it was said that the wood was to be shipped to Palestine for manufacture into "olive wood" something.

Palestine imports less than 1,000,000 feet of lumber a year, not counting railroad the and other timbers. An old line has been in operation there several years and new lines are contemplated. All timbers for railways are imported. Little wood is used in the construction of houses. The larges; it m is the wood brought in to supply orange boxes. Most of this is imported from Romanna.

Woodworking Machines in Germany

A report by Consul General Robert P. Skinner, at Hamburg, Germany, says that American woodworking machinery has not made quite so much headway in Germany as metal-working machinery, there being a good many German devices on the market which have the advantage of being constructed to suit peculiar German requirements. About one year ago the students in the Biltmore Forest School visited Germany under the direction of Dr. Schenck and in the course of their tour inspected the plant of the leading manufacturers of woodworking machinery in this country, at Offenbach on the Main. On that occasion the head of the firm explained that the difference between American and German machinery of this class resulted from differences in economic conditions in the Old and New World. American machinery is built to save labor, whereas German machinery is built to save lumber and power. German machines frequently are combination machines, useful for a variety of purposes in quite small shops, while American machines more commonly perform a single operation rapidly and efficiently and are usually installed in large shops. While American manufacturers specialize as a rule, German manufacturers are expected to turn out every sort of a machine necessary for preparing wood for the market.

Red Oak on Cutover Land

Cutover lands in some of the central Appalachian regions are surprising their owners by the rapidity with which they are growing in value. Ten or twenty years ago the white oak was cut from large tracts, and the red cak was left and was considered of little value because most of it was small. The cutting out of the large timber stimulated the growth of the small, and the red oak has increased so rapidly in size that within a few years a second profitable lumber operation can be carried out on the same land. Red onk grows rapidly, and small timber becomes merchantable in a surprisingly short time, on areas which are so fortunate as to escape severe forest fires.

The Skillman Lumber Company has followed cut its idea of issuing a monthly calendar, and under the picture of each is a suitable verse.

The Sun Lumber Company, Weston, W. Va., has presented a very unusual photographic scene representing three-forking roads under a beautiful canopy of symmetrical forest trees. The scene is very inviting to the equestrian.

Tickle, Bell & Company, Liverpool, Eng., have used one of Thomas Moran's most noted works entitled "The Golden West." This represents one of Moran's awe-inspiring bits of great American western seenery.

The Vestal Lumber & Manufacturing Company, Knoxville, Tenn. has confined itself to a sensible and attractive Christmas and New Year's greeting in the form of a plain white engraved eard with a sprig of green holly and red berries suspended above.

Louis Wuichet, shipper of California white pine and sugar pine, Chicago, has sent out to his friends a handsone leather bound memorandum book, which contains nothing but plenty of space in which to keep memoranda, and in the back is inserted a celluloid calendar for the year.

R. S. Bacon of R. S. Bacon Veneer Company, city, has taken care of his friends in a nicely gotten up pocket memorandum book containing a good deal of valuable information, plenty of room for memoranda, and also a picture of the company's large plant and method of pulling logs by logging boat at the operations of the Bacon-Underwood Veneer Company, Mobile, Ala.

Mitchell Brothers Company, Cadillac, Mich., has just issued an artistic stock list and booklet describing the product of the Michigan forests and the specific products of Cobbs & Mitchell, Inc., and the Mitchell Brothers Company. It is profusely illustrated with handsome forest scenes, depicting specimens of the various species of trees found in the vicinity of Cadillac, which these interests convert into lumber.

E. C. Atkins & Co., Inc., the silver-steel saw people of Indianapolis, have started 1914 with an attractive monthly calendar which they have been issuing for some time.

The Three States Lumber Company, Memphis, Tenn., has issued an attractive pocket memorandum book.

Tickle, Bell & Co., Liverpool, Eng. have sent out to the trade a Christmas greeting in the form of a pretty blotter gotten up in different shades, with a painting of a typical English girl and the personal greetings of Clibert V. Tickle and Ernest W. Tickle on the cover

Gilbert Y. Tickle and Ernest W. Tickle on the cover.
Scatcherd & Sons, Buffalo, N. Y., have sent out their usual practical
memorandum pad, which is surely always appreciated by those fortunate
enough to receive it.

Hardwood Record acknowledges receipt of an attractive desk calendar from the Printing Art, a monthly magazine of printing and allied arts. The calendar is a fitting example of the high-class character of the publication in question.

The M. Rumely Company formerly at Laporte. Ind., has established general offices in the Commercial National Bank building, Chicago.

The Aamax Cabinet Company of Chicago is involved in an involuntary

petition in bankruptcy.

The Kinzie Manufacturing Company of this city is in the hands of a creditors' committee.

The H. P. Nelson Company of Chicago has increased its capital stock to \$1,250,000

Wyman's School of the Woods, Munising, Mich., has issued an attractive and comprehensive catalogue showing the regular curriculum and purpose of that most excellent institution.

-----≺ NEW YORK >=

On January 1 the wholesale firm of Stone, Hershey & Gibson, Newark, was succeeded by Stone & Hershey. As indicated in the new style, this change comprehends the withdrawal of R. V. Gibson, whose interest was bought by Mr. Hershey. The firm will continue in the same lines as before

R. V. Gibson is working on future plans for continuing in the wholesale lumber trade and will handle hardwoods, hemiock and Idaho white pine.

The committee in charge of the annual dinner of the New York Lumber Trade Association is working hard on the many details, and everything points to a good attendance at the Biltmore, February 19. The Biltmore is New York's latest offering in the way of hostelries and has everything that a good hotel should have. The lumbermen will be almost the first to engage its banquet hall, on the twenty-second floor, said to be the finest in the land.

The H. Herrmann Lumber Company and the Herrmann Furniture Company have moved offices to Fourth avenue and Thirty-second street.

THE M. B. FARRIN LUMBER CO.

THE GLUE THAT IS APPLIED COLD ...

In Flush Veneered Doors

The chief consideration is uniformly high grade glue. Manufacturers of this modern type of door realize that its development has been retarded because the unavoidable lack of uniformity in other types of glue makes it impossible to know how long a door will stay in condition. The

Of vegetable glue insures absolute uniformity because of the very nature of preparing it and because every pound of our raw material is rigidly inspected.

Vegetable Glue

Is also a rigid and permanent adherent; will not blister in sanding; has no disagreeable odor; will not deteriorate in standing-for a week if necessary; and can be applied cold without any heating application of any kind in the glue room. In addition, the average saving over former glue bills has been twenty per cent where vegetable glue is used.

A DOOR MAKER SAYS:

McCleary, Wash., 9/30/13.

Perkins Glue Co.,

South Bend, Indiana.

Dear Sirs:—It is now about a year since we added a veneer door department to our operations. Deciding on the glue which would give the best results, we con-sidered the most important matter in connection with this new department.

ints new aepartment.
Investigation convinced us that your product was the
one we wanted in order to turn out the most dependable
doors and panels and it has been gratifying to find that
it has given us low cost as well as superior quality.

excellent mill connections.

Maj. Everett G. Griggs, Tacoma, Wash., was a prominent lumberman visitor in New York last week. Major Griggs was just back from a long trip to Europe, where he made a tour by motor. He views the outlook

-----≺ BUFFALO >=

The lake lamber receipts of 113,735,000 feet last season show a falling off of about eleven per cent from the previous year, but were nevertheless ahead of 1911 by several million feet. For some seasons the people who have brought considerable hardwood lumber into Buffalo by lake have found mill prices on it so high that they have stood out of the trade pretty nearly. Last year seems to have been more unfavorable than former years. One concern that bought a tow on purpose to assist in this traffic scarcely brought anything at all to its own yard and chartered the vessels out to other parties, all because the East will not pay upper-lake prices for hardwood lumber.

O. E. Yeager will attend a meeting of the trustees of the National Hardwood Lumber Association at Chicago on January 13. He states that Buffalo will make every effort to get the June convention.

T. H. Wall and George Repp of the Buffalo Hardwood Lumber Company, are spending a couple of weeks in Tennessee and Alabama, looking over mill stocks.

II. A. Stewart has returned from the Pacific coast, where he recently went on a trip of inspection. He reports that all the lumber interests there are looking for a boom in the spring.

Hugh and R. D. McLean spent New Year's at their old home at Thurso, Que. The former will take a trip this month to the McLean hardwood mills in the South.

The National Lumber Company reports a pretty good demand for the middle grades of maple flooring and oak flooring is also selling fairly well and flooring generally holds firm in price.

W. P. Miller of Miller, Sturm & Miller, spent a week this month in Ohio and Pennsylvania, looking after hardwood stocks. The yard has a good amount of hardwood lumber coming in.

The Erwin Lumber Company, of which George A. Corson is president, is completing a lumber railroad at Erwin, Tenn., which will be finished this month. The company's tract is well covered with various hardwoods

Davenport & Ridley are getting in hardwood stocks from Pennsylvania and report trade as fair. Business is expected to pick up a good deal during the present month.

Anthony Miller reports the hardwood trade as rather quiet this month, but a fair amount of various stocks is being called for and the yard has its usual good assortment.

------≺ PHILADELPHIA >------

J. Randall Williams of J. Randall Williams & Co., says business for the whole year has totaled up fairly well, but as to outlook considerable adjusting to fit the changed tariff and currency bill is necessary before a reliable pronouncement can be made upon future trading.

J. T. Robinhold, secretary and treasurer of the Woodland Lumber Company, says business for 1913 panned out better than was anticipated.

Buying will continue to be conservative until spring.

H. G. Parker of Rayner & Parker, reports very good trading the first eight months of the year, but a falling off in the last four months; the total, however, exceeds that of 1912.

W. S. W. Kirby of the Kirby & Hawkins Company, testifies to a fairly good year, and a promising outlook for 1914. If the railroads succeed in getting the increase of five per cent on freight rates to which they are entitled, they will undoubtedly come into the market for heavy supplies, and spend millions of dollars in improvements.

Samuel H. Shearer of Samuel H. Shearer & Son, says business for 1913 has held its own, and prospects are for a more robust activity in the spring.

William P. Shearer has gone to Atkinson, N. C., to look after affairs at his company's planing mill.

Samuel B. Vrooman of S. B. Vrooman & Co., Ltd., states that 1913 was the best year in the history of the concern. Things are comparatively quiet now and the outlook is uncertain.

J. Elmer Troth of the J. S. Kent Company, reports a very fair year in spite of the numerous obstacles with which it had to contend. The company is hopeful as to outlook.

John W. Coles has no complaint to make over last year's trading. There have been interruptions but the average business has been fair. He anticloates enlarged trading with the oreging of the spring season

If C Magruder, formerly manager for the Patton Company, is now established in the wholesale business for limited with office at his rest

dence, 46th and Walnut Streets

Joseph P. Comegys of the Barker Bono Company. New York and Phila delphia, has been appointed receiver of the business of Harbert Russell & Co. carried on by Frank and George R. Bayle. Auction sale of the stock of lumber was held on December 30, realizing about \$2,000. Mr Comegys is unable to tell just how much the creditors will realize, as he Is not yet in possession of the books and some personals.

E. B. Humphreys of Harry Humphreys & Co., Camden, N. J., says, 1913 lors averaged up fairly well with 1912. Business is quiet pist now and nothing reliable can be advanced as to outlook

The annual meeting and banquet of the Philadelphia Wholesale Laun ber Dealers' Association was held on January 8.

Joseph P. Dunwoody, the popular lumberman, is now associated with the selling department of W. H. Fritz & Co.

The Independence Lumber and Brick Company, Atlantic City, N. J., was

chartered under New Jersey laws, December 22, with a capital of 825,000 Fire visited the showcase factory of John J. McCloskey, December 27, causing damage of several thousand dollars.

John C. Kelley, a veteran carriage builder shed on December 24, aged seventy years. He was a descendant of a family of carriage oudders which in Colonial days built a vehicle for George Washington.

A are in the Penn Upholstered Furniture Factory, on December 28 saused a damage of about \$2,000.

──≺ PITTSBURGH ≻──

The Pittsburgh Industrial Dev language Commission has secured for Pittsburgh the Fort Pitt Box Company which will be located at Etna, a North Side suburb. It will manufacture whisky cases, soap boxes, etc., and will employ 100 men and 50 girls and women.

The Foster Lumber Company has added to its force David Frampton, a well known millman of western Pennsylvania, who will take entire charge of its mill operations. The company now has sixteen mills cutting its own timber and is getting out a big lot of oak and railroad stock.

C. E. Breitwieser & Co. have secured J. A. Walton, formerly manager of the Standard Lumber & Planing Mill Company, and will handle the Standard stocks which are manufactured at Elkhurst, W. Va. It will make a specialty of oak flooring.

The newly organized Dailey & Allen Lamber Company, has got into full running gear in its office on the ninth floor of the Farmers Bank building. Both members of the company are in the South this week buying lumber

H T Lincoln formerly of the old firm of Bemis & Vosburgh has been for the past year a partner in the Gibson Lumber Company which is making fine hardwood lumber at Masontown, W. Va., on the Morgantown & Kingwood Railroad. The company has a five year cut of splendid timber on the Cheat River Gorge.

The Babcock Lumber Company has secured S. E. Coons, formerly sales manager of the Pocahontas Lumber Company of Brookville and Vener, W. Va., to succeed J. B. Mitchell in its sales department, Mr. Mitchell having gone to the Hamilton Ridge Lumber Company where he will be sales manager at Richmond, Va. The Babcock Company has also added G. P. DeWitt, a well-known wholesale lumber dealer of Philadelphia, who will be in its sales department.

The Acorn Lumber Company, through its president, H. F. Domoff, brought back some splendid orders recently from eastern and northeastern territory. It makes a specialty of catering to the manufacturing trade

In that part of the country.

The Aberdeen Lumber Company has got business in the cypress depart ment well under way and will have a strong selling organization. Its president, J. N. Woollett, is thoroughly familiar with all the southwestern stocks and has already made a notable success of handling cottonwood and gum.

----≺ *BALTIMORE* ≻-

Among visitors here during the holiday week were F. L. Winchester, Champion Fibre Company, Canton, N. C.; Bert Crockett, Allen & Crockett, Black Mountain, N. C.; Mr. Dickey, Dickey & Campbell; C. J. Diebold, Forest Lumber Company, Pittsburgh; Mr. Chambers, Kendrick Lumber Company of Pittsburgh, and Irwin Clark, the Boice Lumber Company, Richmond, Va. Some were on their way home to spend a part of the holidays, while others had been at headquarters and were making a midholiday trip. All reported quiet, as was to be expected.

Edward Healy, who represents John L. Alcock & Co. in West Virginia, with headquarters at Charleston, has gone back to the field of his activities after a brief vacation spent at home over Christmas. Healy stated that toward the end of the year things had quieted down,

though prices were fairly well maintained.

Two of the field men of Richard P. Baer & Co. were also in for the holidays. One of them was C. E. Williamson, a former Baltimorean, who represents the firm in Ohio and adjacent territory, making his headquarters at Columbus, and W. W. Wilhelm, who is located at North Wilkesboro, N. C., where the Giant Lumber Company conducts operations. R. P. Baer & Co. handle the output of the Giant company and Mr. Wilhelm stays on the ground to look after matters. Both visitors have once more gone back to their regular work.

Walnut for Export

Thirty years' experience in the handling of walnut logs for export enables me to furnish guaranteed prime quality stock.

I am constantly in close personal touch with the source of supply of export walnut logs and know exactly what I am getting at all times. In fact, a number of the best foreign houses are taking up my logs on my own recommendation.

My supply enables me to fill orders of any size in carload lots without delay.

Highly Figured Walnut

As a result of close personal supervision of log purchases my stock of highly figured wal-nut in long wood and stumps contains only the choicest in figure and curl that can be found.

All this stock is carefully selected to take care of a discriminating demand.

My figured stumps are all dressed closely and when shipped are practically in shape for the knife.

Youwill lose nothing by trying me on your next inquiry.

> FRANK PURCELL = Kansas City, Mo., U.S.A.

MATHEWS STANDARD Gravity Lumber Conveyer

Made all steel, ball bearing rollers, eight foot sections; easily coupled together and assembled to form line of any required length, over which lumber, flooring, dimension stuff, etc. will travel on a four per cent grade. Adjustable tacks supplied to support conveyer line and secure proper grade. Light, strong and easily portable. Been in successful use for past ten years.

Prices quoted on receipt of information as to lengths and widths of materials, and total distance to be conveyed. Send rough sketch showing requirement. Ask for catalog.

W. W. GARY, INVERNESS, MISS.

Fig. West Ver, not I indeer company has been running its new mill at cereating West visions twenty index from Charleston, on the Chespeake & Olive's frond - 2g vity, though, of course, the plant was shut down over the obstacle of the Land is an eight foot band, of strictly modern design, and has been turning our about 40,000 feet of lumber a day.

It seems to be settled that no more wooden block parements will be laid in Baltimore, the mayor and other municipal officials being opposed to the tender of sevenent notwithstanding its advantages. Some vears ago the streets around the courthouse were paved with wooden blocks in order to deaden the noise of vehicle traffic, but as some of the streets have sharp inclines, they proved almost impracticable for horses in snowy weather. Even during rain storms horses would fall, and it became necessary to sprinkle sand or ashes during every storm. It is said that the city has spent \$1,700 a year for sanding such pavements.

=≺ COLUMBUS >=

J. I. Marajas a lumberman of Marietta, O., is the inventor of a vencer drying machine upon which he has secured a patent. He will organize a company for the manufacture of the apparatus at Williamstown, W. Va.

I' B. Pivor of the W. M. Ritter Lumber Company says trade in hardwoods has been fairly active during the past fortnight. He says factories are the best purchasers at this time. Dealers have just completed their inventories and will soon be in the market. Prices are holding up very well in all grades and varieties of hardwoods.

J. W. Mayhew of the W. M. Rifter Lumber Company is again confined to the bostot J. in. Mrsss

R. W. Horton of the Rifter company left early in January for a long business true in Buffalo territory.

John R. Gobey of the concern bearing his name reports a fairly good demand for hardwoods, with prices holding up well in most particulars. He says the prospects for the future look very bright,

J. W. Rogers a well-known lumberman of Hattiesburg, Miss., visited wholesalers in Columbus recently.

D. W. Kerr of the W. L. Whitacre Company left early in January on an extended business trip in the South.

J. A. Ford of the Imperial Lumber Company says trade in hardwoods is a good as could be expected under the circumstances. There is a good demand for most varieties and shipments are coming out promptly.

Ruiding Inspector Goodman of Akron, O., estimates that the cost of proposed buildings to be creeted in that city amounts to \$2,250.000. A large number of new structures are to be erected on Main street. Among them are the new Union station, a new postoffice building and several business blocks.

A building boom in Columbus is on despite the general business depression which prevails. John A. Kelly, secretary of the Columbus Builders' and Traders' Exchange, says that new buildings are projected which will cost more than \$8,000,000.

According to the statement of Inspector Dauben of the Columbus building department, permits issued during the year totaled \$5.508,400 which is almost \$1,000,000 more than the valuation for 1912. The year 1913 was the largest in the history of the department. The month of December was a record breaker as permits valued at \$432,550 were issued as compared with \$157,473 in December of the previous year. The total number of permits issued in 1913 was 3888 as compared with 2656 in 1912.

Collin Ford has been appointed receiver for the John Deitz Manufacturing Company of Cincinnati.

F. A. Keil of Dunbridge, O., has purchased a site in Bowling Green, O., upon which he will erect a planing mill and lumber sheds.

The Throop-Martin company of Columbus has leased the property at 130-140 East Chestnut street for offices and factory for its door and sash concern.

A number of lumber concerns in Ohio are going to carry their own insurance under the Ohio workmen's compensation law instead of paying into the general fund a certain percentage on their semi-annual payrolls.

The Clay Tie & Lumber Company of Chillicothe, O., has been incorperated with a capital stock of \$5,000 to deal in lumber of all kinds and railroad ties. The incorporators are Harvey Clay, William R. Snyder, Lillian F. Snyder, Sallie S. Herrnstein and William Herrnstein.

The Harris Lumber Company of Dillonvale, O., has filed papers with the secretary of state increasing its capital stock from \$30,000 to \$75,000.

The Kinney Lumber Company of Orrville, O., has been incorporated with a capital stock of \$42,000 to carry on a general lumber business. The incorporators are Angeline Kinney, Eugene L. Kinney, Fred W. Kinney, Ralph A. Kinney and T. A. Kinney.

Upon the application of the Franklin Construction & Supply Company, made through its attorney, M. L. Bigger, Judge Frank F. Rathwell of the county courts, recently appointed E. N. Paul receiver of the Sciotio Box Company of Columbus.

The Benn Lumber Company is the latest addition to the lumber concerns in Clucinnati, the officers of the company, being Ben Rubenstein, president; E. O. Robinson, vice-president and F. W. Mowbray, secretary-treasurer. E. O. Robinson and F. W. Mowbray are members of the Mowbray & Robinson Company and are experienced and widely known hard-wood men. Mr. Rubenstein is from London, England, and has represented the Great Eastern Timber Company of London, in this country for several years. The new concern will manufacture and deal in hardwood lumber. The bulk of this lumber will be experted.

W. W. Knight of the Long Knight Lumber Company, and Mrs. Knight have returned from a ten days' visit with relatives in LeRoy, N. Y.

The marriage of John H. Guy and Miss Gorda Schbelen of Laporte took place in New York City, December 31. Mr. Guy is financial vice-president of the M. Rumely Company. Mr. and Mrs. Guy will reside in Laporte.

With a loss of approximately \$100,000, most of the plant of the Indi and Veneer and Lumber Company, Menon railway tracks and Twenty third streets, Indianapolis, was destroyed by fire on the night of December 22. The fire, starting in the center of the dimension room is believed to have been caused by an incendiary. The southeast wing of the plant and the office, in a separate building, together with several piles of lum ber and logs, were saved. The company makes a specialty of white oak veneer, and expects to rebuild

The city officials have agreed to recommend the amendment of a section of the new building code that has aroused a protest from the hardwood interests and manufacturers of interior trim. As passed, the code requires metal doors, sash and trim in all fireproof structures, at the same time requiring all schools, hospitals and apartment houses three stories or more in heighth and all other buildings more than one hundred feet high to be fireproof. The amendment will limit the requirement for metal sash, doors and trim above the one hundred foot line

=≺ *MEMPHIS* **>**=

The annual of the Tight Barrel Stave Manufacturers' Association will be held here January 20-21. This is the first of the big conventions that will be staged in Memohis during the winter. The sessions will be held at the Hotel Chisca. It is expected that there will be about 125 delegates in attendance. Max Lowry of New Orleans is president of the association and E. H. Defebaugh of Chicago is secretary-treasurer. The annual of this association will be closely followed by that of the Hardwood Manu-Association of the United States, which will convene on January 21-22.

Lee Wilson, head of Lee Wilson & Co., prominent manufacturers and distributers of hardwood lumber, with headquarters at Memphis and milling interests chiefly in Arkansas, has bought for himself and associates about \$300,000 worth of the levee bonds authorized by the last legislature of Arkansas. This transaction is regarded as of more than passing importance for the reason that it places at the disposal of the St. Francis Levee Board sufficient funds to enable the latter to proceed with the strengthening of the levees under its control and the bringing of these embankments to a standard that will prevent breaks such as have proven quite disastrous heretofore. Lee Wilson & Co. and some of the other big hardwood lumber interests own extensive timberland holdings and conduct large milling operations in the territory protected by the levees in question, with the result that the importance of this movement is evident.

There has been considerable correspondence between the big lumber companies which were recently heavily fined by the supreme court of Missouri and ordered to leave the state, and the secretary of the Business Men's Club. 'The latter has extended to these companies a warm invitation to come to Memphis and make this their future home, dwelling at length on the advantages offered by this center. Secretary Tuther has further advised these companies that if they do not know enough about Memphis as a lumber center to satisfy themselves that this is the place for them to come he is willing to use the machinery of the club to compile such data as they may desire for their further enlightenment. That this invitation is being duly considered by some of these companies is quite evident from the letter received from the Lewis Warner Saw Mill Company of St. Louis, to the effect that "We will be sure to give Memphis due consideration, as we recognize its many points of advantage and as we are not unmindful of the pleasant features of the city's social life." The Business Men's Club will continue its activities in this direction until these companies have either located here or decided upon some other point as their future home.

E. H. Ewing, formerly manager of the E. H. Ewing Lumber Company, whose plant was recently destroyed by fire at Heber Springs, Ark., has made plans for the establishment of a wagon factory at that point, and this will be placed in operation shortly. Agricultural implements, too. will be manufactured. Earle Brice and Louis Thompson are associated

about three a fear weeks ago, entailing a loss of about \$25,000, with no insurance. The outding has been rebuilt and the new machinery will be the cut-of a constraint.

1. If I want reconcily manager of the E II Ewing Lumber Company of Heart species. Ask whose plant was destroyed by fire a few weeks ago, is now at the head of a new goneern that will establish a new industry as the cuts. The new company, composed of Mr Twing, Earl Brice and Lewis Thompson, has recently purchased the old Gardiner gin plant and proposes to convert if into a wagon and implement factory. The new industry will utilize the almost inexhaustible supply of white oak and other hardwoods in that section. The machinery for the new plant has been preclased and will be on the ground in a few days, at which time the week of meaning by with be found.

According to the report of the Linted States Consus Burgan, Arkansas leads and the states of the Linion in the preduction of red gum for the year 1913. The total number of feet for the United States is given at 694,260,000 feet, and Arkansas' part is placed at 211,920,000 feet.

It is said that the movement for the lumbermen's excursion, making a tour of Arkansas and visiting the large mills of the state, is again to be revived by the Arkansas Lambermen's Club. The plan now is to take the trip in the early spring. President C. A. Bushner plans within the next few days to appoint a special committee to look into the excursion project and arrange for the week's schedule. This trip will be participated in by both hardwood and yellow pine manufacturers, and through it they expect to gain rauch information concerning the other fellow's method of operating mills. They will also devote a considerable part of their time and attention to colonization work and plans for selling cut-over timber-lands.

--> WISCONSIN ≺=

B. H. Roderick of Juda has purchased the branch lumber yard of the Heddles Lumber Company at Brodhead and will operate it in connection with the yard at Juda, having an assistant at the latter place.

The Kewaune Manufacturing Company of Kewaunee is erecting a third story to one building and a fourth to another to facilitate the manufacture of furniture and wooden fixtures.

Peter Epley Wilson, manager of the St. Louis interests of Knapp. Stout & Company, lumber manufacturers, from 1894 until the business was closed in 1904, died at Menomonie on December 29. He was president of the Wilson Land and Lumber Company, having charge of its St. Louis business at the time of his death. He was also connected with the St. Louis Lumber Company. Mr. Wilson was a former mayor of Menomonic. He was a son of the late T. B. Wilson, Sr., and a grandson of Capt. William Wilson, founder of Knapp, Stout & Company. He leaves a wife and two children, besides several brothers in business at Menomonfe.

William F. Rediske, secretary-treasurer of the Interior Woodwork Company of Milwaukee, has been nominated as candidate for president of the Builders and Traders' Exchange of Milwaukee. The election will be held Tuesday, January 13.

George Langley, one of the best known lumbermen and loggers in northern Wisconsin, married Miss Mayme Strickland, a prominent club woman and educational worker of Merrill, Mr. and Mrs. Langley will reside in Merrill.

The Wisconsin Retail Lumber Dealers' Association will hold its convention at the Hotel Wisconsin, Milwaukee, February 17 to 19. More than five hundred retail lumbermen from all parts of the state are expected. The officers are: Frank Bodden, Horicon, president; Albert Schaller, Janesville, treasurer, and Adolph Pfund, Milwaukee, secretary,

The factory of the Schoen & Waiter Company, trunk manufacturers, Milwaukec, was threatened by fire when an adjoining structure burned. The fire department saved the plant after a hard fight.

The Wisconsin Woodworking Company of Two Rivers has received one of the largest orders for woodenware ever placed in this country. The order covers 57,000 dozon palis to be delivered during 1914. It will require sixty furniture cars to handle the product. The raw material, such as wire, heading material, bottom stock and staves, will require six hundred cars. J. F. Conant is at the head of the company.

The Wisconsin & Northern Railroad Company received a new engine at Shawano direct from Schenectady, N. Y. The locomotive is larger than any of the present ones, which was necessary on account of the increase in the size of the logging and freight trains.

The Northern Casket Company of Fond du Lac is making improvements which will include the erection of a third story to the wooden portion of the plant, the installation of an automatic sprinkler system to protect the entire structure against fire, and the installation of an automatic doverail glue joiner, the only machine of its kind in this section. The addition will be 60 by 120 feet and provide 7,200 additional feet of floor space. It is made necessary by the increase in the company's trade in solid mahogany, Circassian walnut and fine oak cabinets.

The Northern Floor Surfacer Company of Green Bay has recently perfected a machine for rubbing baseboards and wainscoting. The floor surfacing machine of the company has met with decided success and the new product will likely find favor. A machine has been shipped to Chicago, where it will be used on twenty miles of terrazzo base in the new Cook County hospital.

The Forest Service station maintained at Wausau by the United States department of agriculture has been closed and the machinery is packed for shipment. The electrical equipment, advertised for sale, as noted, has

not been sold because of the owners. It will be stored at the feest product behavator, at Manische, G. C. M. Naughton was in charge of the station

five additional men to the woods to assist in the work of skidding logs to the parallel tracks on which they are hauled from the woods by steam, The method of logging renders the loggers independent of the season, as logs can be hauled as readily during the summer as during the winter. The sest in has been in the corresponding to a construction for the past two years and the compacted pasts have seen a very successful. With the old system of harding the logs on sneight with houses the company was required to employ a crew of some seven hundred men during the winter Now there are about 135 men engaged all year around.

The Minneapolis, Merrill & Marinette Railway Company, a newcomer into the lumbering country of northern Wisconsin, recently noted as being organized, has amended its articles or incorporation. The original articles provided for a line from Mar I northwest to Prentice, the new terms

providing for a line from Merrill to Antigo.

The right of Indians who have been extended citizenship by the government to sell their land grants after the allotment on reservations and before the secretary of the interior issues the patents perfecting ownership is involved in a test case heard by Judge Geiger in the United States district court at Milwaukee and taken under advisement. The case is being conducted against August Anderson, a wealthy lumberman of northern Wisconsin. Many thousand acres and millions of dollars ultimately may be affected by the outcome of this suit, the first of its kind instituted by the government seeking to enforce return to the Indians without cost of all lands sold before issuance of the patents. In reclaiming the timberlands for the Indians the government will void the sales to lumber interests. The case will likely find its way into the United States supreme court.

The Arpin Hardwood Company of Stevens Point has filed an amendment to its articles of incorporation increasing its capital stock from \$300,000 to \$600,000.

The H. Barkow Company of Milwaukee has been incorporated with \$40,000 capital stock. The concern manufactures wagons at 195 Milwaukee street. H. Barkow, Fred Barkow and William Barkow are named

The Oberbeck Brothers Manufacturing Company of Grand Rapids has made a change in the firm name and will now be known as the Ahdawagam Furniture Company. The new name is a literal translation of "Two Rapids" into the Chippewa tongue. The change was made because of a reorganization of the concern and also to avoid errors in shipments and mailing of matter for this company, which often first goes to Grand Rapids, Mich.

The Gagen Lumber and Cedar Company, recently organized at Gagen, Wis., has purchased the complete sawmill plant of the Minneapolis Cedar and Lumber Company at Gagen. The purchase includes the townsite, saw and planing mill, steam log hauler and equipment, general store and The concern has started logging operations and will timber stumpage. begin operating the sawmill early in the spring. The mill and general offices of the concern are located at Gagen, and a Minneapolis office at 512 Lumber Exchange, Minneapolis, Minn. The company is incorporated for \$125,000 capital. The owners are William Miller and H. Hauser of Minneapolls, Minn.; F. H. Piehl and R. C. Luedke, Gagen; and F. W. and W. F. Piehl, Seymour, Wis.

The Oconto Company at Oconto has a crew of twenty-five men at work in and around its big mill cleaning up in preparation to making extensive improvements. Old machinery is being removed and replaced by modern, and the capacity increased to facilitate the sorting and manufacture of lumber. William Beaudin is in charge of the work, which will require a large force of carpenters throughout the winter. The Holt Lumber Company has undertaken similar improvements, the crew being in charge of F. P. Ferguson.

The Keith & Hiles Lumber Company at Crandon will start up its sawmill within a few days. The mill has been thoroughly overhauled and improvements made. The company has had a large force of men in the woods for the past three months and has several million feet of logs ready

to load on cars on the logging railroad.

The large new dry kiln of the Menasha Wooden Ware Company at Ladysmith, which has been completed for some time, is now in operation. Fifteen additional men are employed in this department.

The W. H. Rogers Lumber Company of Nashville has sold all the lumber that it will cut this season to Brown Brothers Lumber Company of Rhinelander. The Rogers company recently purchased five forties of timberland at Dry Lake, near its logging railroad.

The American Parlor Frame Company of Sheboygan has installed a new automatic sprinkler system in its plant. The work was done by the American Sprinkler Company of Cleveland, O.

The Hatton Lumber Company of New London closed down its big sawmill during the holidays for repairs to the mill and the log slip preparatory to the winter season's run. Except those employes who wished

one boundary, insuring uniform color and texture: manufactured at our new hardwood flooring plant.

Start Somewhere

No proposition can be accurately figured out unless a starting point is first established.

Did you ever encounter a man who professed that he was entirely satisfied with his lumber

Will not even the expert tell you that occasionally his lumber comes through his kiln just right the next time it is too green-the next time it is too dry the next time that it is checked, warped or honeycombed?

There is a reason for it.

Usually it is not the fault of the dry kiln.

How can it be expected that woods of various texture, various thickness or at various stages of air dryness can be subjected in a kiln to the same heat, the same ventilation, the same duration of time and accomplish uniformly satisfactory results?

It is an impossible proposition.

START SOMEWHERE

Start with lumber that is uniform in texture and dryness through and through.

The solution of all lumber-drying difficulties is the employment of

raetzer-cure

This is lumber treated with steam under pressure in the Kraetzer Patented Preparator.

Lumber that has been treated in this apparatus is fit for the kiln, whether it be 30 days old, 60 days old, or six months old; is delivered without check, split, stain, warp or other seasoning defects, and is of an uniform and mellow texture and color.

This lumber can be satisfactorily kiln-dried in the simplest form of a kiln in one-third of the time that ordinary air-dried lumber requires.

The kiln will deliver this lumber as it received it,

save for dryness. Its milling qualities will be vastly improved, as also

its strength and elasticity. The big loss in shrinkage will be avoided.

Furniture or interior finish made of Kraetzer-cured, kiln-dried wood will hold its glue joints, stay where it is put, and the shrinkage and swelling, even under violent atmospheric changes, is almost nil.

It will take filler and even water stains without per-

ceptible raising of the grain.

We will cheerfully supply the names and addresses of all lumber manufacturers who employ the Kraetzer Preparator, naming the kinds of woods they produce.

Buy one car of steam treated lumber, handle it through your kilns and into your finished product, and you will be convinced that you cannot afford not to use Kraetzer-cured lumber.

The same desirable results can be achieved on ordinary air-dried lumber with a Preparator as an adjunct to your dry kiln.

The Kraetzer Company 537 S. Dearborn St., CHICAGO

a victors during this time, the men were employed on other work while improvements were under way. With the opening of the mill noth day and to lift shifts will be put on and provide many laborers with

A deal has seen consummated at Fort Atkinson by which the James Manufacturing Company has taken over the wagon works of Landgraf & Wandschus day on South Water and Cooper streets. The James company only short year cold a large addition, out it is again in need of additional room and to took ey'r the wagon works. The former owners will be connect d with the James concern

tistacshe announce concerns have been closed during the usual annual period to make repairs and improvements and take inventories. Pame Lumber Company closed for a longer period than usual, with twothirds of the employes laid off. The Diamond Match Company is planning a large inequest addition, approximately 65 by 110 feet and four stories high. The R McMillen Company is making improvements to its plant. The Loster Lothman Company is considering equipping its plant to manufacture veneered doors. Work will be resumed in full force shortly,

The Wachsmith Lumber Company recently closed a successful and the longest season in the history of its mill at Bayheld. Eight steady months of work was the 1913 record.

The Hardwood Market

=≺ CHICAGO ≻=

Local lumbermen have not been able to determine in the few days since the closing of the old year whether or not there is real justification in the optimistic predictions that were expressed in December regarding the new year's business. The situation continues to be quiet, but of course this is only the natural condition of affairs as in but few cases have the affairs of the consuming factors been entirely straightened out along the new routes and they have not been doing much within the last week or ten days even in current business on lumber for immediate use. majority of the local trade, however, seem to think that the tone of the inquiries regarding stock is a little more favorable than it has been and are taking hope from this indication. It is impossible to tell of any distinct developments in the local market other than to state that the general tone is really favorable and the expressed opinion of the majority of local hardwood men is that within the next two or three weeks the condition of trade in Chicago will be noticeably improved.

Since the passing of the currency bill a hopeful, optimistic atmosphere pervades the business world, but at this writing there are less stable indications of improvement in the lumber market. There are few, however, who do not feel that better times are on the way, if not at hand, and a steady, slow return to brisk trading is looked and hoped for rather than a sudden rush of business. The money market, which has been so tight for the past half year, is sure to become easier, and with this a better building activity is bound to come, and consequently a better demand for lumber. Local yards report only a small volume of business, while the manufacturing trade is good, and bad, in sections.

Prices continue with slight change; ash is again active and firm, while chestnut and poplar saps are weak. The hardwood flooring market is off a little, but no great reductions are noted.

—≺ BUFFALO ≻—

Hardwood dealers are hopeful regarding trade in the near future, although business just now is quiet, partly on account of the holiday and inventory season. As soon as these are over business will no doubt show improvement. The general business situation is not so good as it might be, but dealers feel that it has improved somewhat as the result of the passage of the currency bill. It is thought that large buyers will begin to take hold of lumber better than before the bill passed.

The outlook for hardwood trade this year is regarded as favorable, and dealers see no reason why business should not go ahead in good shape. Some of the lumbermen are predicting a brisker year than 1913 turned out to be, while others say trade will be about as good as it was then, but that buying will continue in rather small lots. All prophecies are for pretty good business and for a firm market. Not much change in prices is looked for. Among the chief woods in demand at present are maple, birch, oak and ash.

=≺ PHILADELPHIA >=

A suspended activity is always to be expected in the hardwood lumber business during the holiday season, and no especial effort will be made to get new business until it is over and the balance sheets taken off. Nearly all of the leading firms have called in their salesmen to celebrate the yuletide festivities with their respective families. Notwithstanding the pessimistic prognostications of an approaching panic for whch the changed tariff and the new currency bill should be responsible, now that these bills have really been passed and entered on the statute books, there seems to have immediately followed a relieved and distinctly optimistic attitude as to the outlook for 1914. Upon the ears of all broadminded and constructive metalants to a covered a financial octopol with the arms reaching out for unsuess destruction for harm essential get together the hour according to the get together specific to hour according to the greatest good as rampant, and a horyant advance is looked for the end of the first norther than one were it. Many wins whose near the mount for the first norther than one in the specific property of the metalating up of steelah and deal occounts for the whose near the region to the forthing up of steelah and deal occounts for the whose near the region to admit that the showing of 1904, its given according to the largeon of structure both at mill and selling radius in via good skie. Weatever standing there is in a strain woods is traceased to energy to the conservative boving during the last few mouths, are below normal and naturally will need replenishing before one and as the nine varies at no burdened with an overplus stock, the first fish for goods with so an upward frond in values as along the line. As there are a nine set of concerns which, it order to reduce their ewit stock before toking a certain showing of the a transtation of values.

───≺ PITTSBURGH ≻

Hardwood men were seldom an better shape to take advantage of the rise in market prices than now. Stocks are low and yet lumber can be bought from the units in pretty good supply it for spring delivery. Nearly all the hardwood mills in triestate territory are working practically full hand of Manufactures who use herdwood have very little stock on band. There is a feeling all around that business will be better, especially if the railroads get their advance in freight rates and this means that the hardwood non are going to come in tora harvest.

==== **≺** BALTIMORE **>**=

For the present there is little to be said about the hardwood tradewhich, in common with other activates is affected by the diverting in thenees incidental to the beginning of a new year. Pronounced quiet prevails, but this is to be expected, and has not affected the situation in so far as prices and other general conditions are concerned, though it has of course a very decided influence upon the movement. During the past week or two some orders have come in, but the aggregate was not at all impressive, the mainfacturers as well as the dealers and consumers desiring to know just where they stood before they undertook to engage in new commitments. Now that this work incidental to the close of thyear is almost, if not entirely, out of the way, the demand may be expected to pick in and regain its normal volume. Indications concerning the more immediate future are entirely reassuring.

A fairly active interest is being shown in the foreign trade. Buyers on the other side of the Atlantic are not so engrossed with the holiday spirft, apparently, as is the case in this country, and numerous inquiries from them are oeing received. In fact, the foreign movement is raising some agreeable expectations, and exporters express themselves as very hopeful over it. The demand covers practically the entire range of woods, and is of such proportions as to indicate that the stocks on the other side had been materially reduced. As for the domestic business, it still shows the effect of the holidays, though members of the trade generally are getting back to the ordinary business. The shrinkage in the move ment was of course expected, and occasioned no surprise, nor was it allowed to affect values in any appreciable degree. The easing off in common chestnut and common poplar is yet in evidence, but the rest of the list is quite firm and may be said even to show a hardening tendency, although so far there has been no fair opportunity to test the strength of the market.

When stock taking and other similar matters have been finally disposed of and when the ordinary demand reasserts itself it will be seen to what extent lumber is reflecting the improved feeling that may be said to prevail. Stocks are unusually light at points of production as well as elsewhere." Little would be required to bring on a positive scarcity, and in the event of unfavorable weather such as would compel the mills to shut down for any length of time a marked advance in the quotations could be looked for. Despite the easing off in the quotations noted in the last few months, the mills did not accumulate lumber in any considerable quantities; in other words, the recession in some of the prices was due not to heavy offerings of lumber, but to a slackening in the demand owing to obvious causes. With the removal of these causes and a getting back to anything like the conditions that are to be looked for. the movement will be greatly augmented, and the effect of the limitation upon the offerings will be disclosed. This effect, it is thought, will be a decided rise in the quotations.

=< COLUMBUS >=

Despite the dullness attending the holiday season, the hardwood trade in Columbus and central Ohio has been fairly active during the past fortulght. Demand has been pretty well distributed among the various grades and varieties, and the movement is all that could be expected under the circumstances. The general business depression which prevails will undoubtedly affect the hardwood trade, but to the present time no serious effect is noted.

The demand on the part of factories is the best feature of the trade, While a number of factories closed down for inventories, most of them are resuming operations. Buying on the part of factories is expected to We offer the following stock of our own production, from good logs. Consists of good widths and lengths. Is band sawn and carefully edged and trimmed.

*Indicates stock dry enough to ship within 60 days; remainder of items ready for immediate shipment. The item of Core Stock is a special grade, suitable for veneering over. This is thoroughly dry and we are prepared to quote an attractive price.

All Red and Sap Gum in grades of No. I Common and Better is Kraetzer-Cured, insuring the lumber to remain straight and dat and to be absolutely free from stain. Kraetzer-Cured Lumber is of a soft, mild texture and uniform color.

We have facilities for kin-drying and surfacing. We have facilities and uniform control constites, car stock, bridge and crossing plank.

VIEW OF MILL SKIDWAY, WITH PART OF LOGS STORED IN BACKGROUND-WE HAVE 6,000,000 FEET OF SELECTED HARDWOOD LOGS STORED ON OUR MILL YARD.

increase after the stock takin, and I rejuding concerns are now engaged in their semi-annual shows and a course there is dullness in that department of the trade. Trapt to not and which concerns are good only ess.

Retailers are also buying in limited quantities. Their inventories showed that stocks were light and they in orying some to replace stocks which are needed at present. Dry stocks are only fair and as a result prices are expected to be well maintained. The car supply is all that can be desired and shipments are coming out promptly. Building operations in outside work have practically stopped for the season but there many new buildings projected for the coming season.

Prices are rather firm all along the line. Some cutting is reported but these are isolated cases. Under present conditions quotations are not expected to decline to any great extent for the coming few months. Col-

lections are not so good as might by desired

Quartered oak is firm all along the line both for firsts and seconds and No. 1 common. The same is true of plain oak which is selling well. Poplar is gaining in strength, especially the lower grades. Chestnut is moving well and the same is true of basswood and ash. Other hardwoods are unchanged.

=≺ CINCINNATI ≻=

There is a very strong feeling of optimism among lumbermen over the prospects for a much improved business. On every hand one hears expres sions of confidence at the outlook. There is no question that the passage of the currency bill has had a lot to do with this feeling among the dealers. The bill is considered by bankers to be a very good one, much better than was expected. The amendments to the original bill, which, by the way, was not at all approved, has had the effect of stimulating a lack of confidence to one of expectation of much improved collections, which alone should be of much assistance in restoring business to a normal condition. Bankers claim that money will be much easier when the new law is in force and that they will be able to pursue a much more liberal policy toward their customers. The factory trade, upon which so much depends, is looking real good, and the chances are that in another month they will be heavy purchasers of all kinds of stock, as it is a well-known fact they are very low on stock on hand, having pursued the hand-to-mouth policy so long that they have little on hand. They will likely let the dealers carry the stock to considerable extent, as in the past few months, but buying is bound to be on a much more liberal basis. Plain oak appears to be strong: at least the many inquiries point that way.

— ≺ INDIANAPOLIS >=

Hardwood lumber interests in Indianapolis and vicinity are looking forward to a moderate business in 1914. At present, of course, the market is more or less inactive, the volume of business probably being smaller than in January of last year.

Fair prices are being maintained on all grades of hardwood, with the possible exception of gum, which has suffered a considerable slump during the last few months. Until the state can recover from the inancial situation that has existed since last August, no great improvement in any line of business is expected. It can be said, however, that the financial situation is gradually improving.

—< MEMPHIS >—

The export market is rather quiet at the moment, and the reasons assigned for this condition lie in the tendency toward lower ocean rates and the consignment of large quantities of lumber to European firms. The former makes buyers disposed to hold off, in the hope of securing advantage of the lower rates, while the latter has always been one of the most disastrous features affecting the handling of legitimate business between exporters on this side and importing firms abroad. A prominent exporter here is authority for the statement that the consignments on the other side at present are quite large and that their presence makes bona fide sales quite difficult to put through. He says that the markets where these consignments are noted-principally Liverpool, Antwerp and Belglum-are demoralized to such extent that the legitimate exporter is handlcapped beyond the possibility of effecting sales on a profitable basis. The Hamburg-American line has reduced rates voluntarily five cents per hundred pounds between New Orleans and Hamburg, and there is some talk of lower rates on the part of some of the other steamship companies. The latter, however, are still holding out for pretty full rates, so much so that the committee recently appointed by the Southern Hardwood Traffic Bureau to make a thorough investigation of the alleged discrimination of the steamship companies out of New Orleans against Memphis and the Memphis territory is still actively engaged in carrying out the instructions of this body. Ocean rates as a whole, however, are more unsettled than they have been for a long while, and the knowledge of this fact tends to restrain importations of lumber on a large scale,

=< BRISTOL >=

The Bristol lumbermen are encouraged at the outlook for business during the remainder of the winter and spring. They expect a better demand for hardwood lumber than characterized the market during the closing weeks of the past year. The yards in this section are fairly well stocked and the mills, as a rule, will get in good time during the winter. There are fewer mills idle than is usual at this season of the year.

Mahogany and Circassian Lumber & Veneers

¶ The largest assortment of finest figured Mahogany Logs, Lumber and Veneers in the country can be found at the Chicago plant of C. L. Willey.

¶ We are just in receipt of fifteen cars of remarkably superior Circassian Walnut Logs, large size, well-figured and of good color, which are now being cut into Veneers.

¶ A visit or correspondence from discriminating buyers of all varieties of fine Imported and Domestic Cabinet Woods in Lumber and Veneer is solicited.

¶ You will not only find the Willey warehouses well stocked with a superb collection of Circassian, Mahogany, Vermilion, Black Walnut and other fancy foreign and domestic lumber and veneers, but buyers are assured of prompt and painstaking service, and a quality of product not usually obtainable.

¶ To visit the plant take Blue Island Ave. car at the postoffice to Robey Street.

KANSAS CITY

==≺ LOUISVILLE >=

Stock taking vas kept everybody in the hirowood business busy during the past few days and has likewise interfered with the movement of bunner, as buyers have of course been engaged in the same task. With this work completed and 1913 figures a matter of history, however, it is expected that oursness will show a marked improvement. Stocks in the hands of users of bumber are tight, and as there is a relatively small supply of aumber en sticks as well as of logs, the situation generally is favorable to a strong market. General Lusiness conditions appear to have improved considerably, and this should encourage manufacturers to go ahead and plan their year's work on a normal basis. The movement of humoer during toe past two weeks has been smaller than heretofore, but about normal for the season. A good many shipments were made which web wooked some time ago for delivery after the first of the year. Hard wood men report no recession in prices, but have found buyers who actually want lumber to be willing to pay the usual prices for it.

—≺ ST. LOUIS ≻=

Business has been very quiet during the past couple of weeks. The traveling men are all in enjoying the holiday season at their homes and assisting in stock taking. This has been going on for several days, both by the distributors and the consumers. While the figures as to business done during the past year have not been compiled, enough is known to show that business has not been quite so bad as was expected. In fact the year's business will show up pretty well, considering the conditions that have existed. The prospects for the year just beginning are quite tavorable as stocks are low in the yards of both retailers and consumers and buying must soon commence. The cypress situation is quiet. The same state of affairs will likely prevail with the cypross people as with the other hardwood interests. The outlook is quite encouraging, owing to the light stocks held by retailers and consumers.

===≺ *ARKANSAS* **>===**

The dealers in oak of this state are finding the market good. While there is considerable complaining among lumbermen in general, and especially among those doing business in eastern Arkansas, because of the slack condition of the market, the market for oak timber is still strong. It is said that cak sawed material has never brought the prices it is bringing at present. The market on other items, such as gum, is a little off at present, but the strong market for oak more than makes up the difference among the average hardwood manufacturers.

=≺ MILWAUKEE ≻=

That the local millwork situation during the year just closed showed a marked improvement over that of the proceding two years is the belief of local manufacturers in that line. The small amount of stock work has been a disappointment, especially to the larger manufacturers, who, to operate advantageously and economically, require large stock runs. The odd and special work, however, has kept them operating almost full capacity. Still further improvement is looked for during the coming year.

Manufacturers say that conditions in the general lumber trade were very satisfactory during the early part of the year, a result of the active building operations. The stringency experienced in the money market later in the year, resulting in a scarcity of capital and a high rate of interest, curtailed building operations somewhat during the last two months of the year. The natural result of this situation would seem to be that considerable business will be carried over into 1914.

Manufacturers and general consumers of bardwood are still busy with their annual inventories and this is expected to curtail business for a time. Wholesalers believe that buying will become more active during the latter part of the present month. Stocks in the hands of dealers and the general factory consuming trade are light, as most of these people have been buying mainly to satisfy their immediate wants. The available supply of dry stocks is far from being large and wholesalers are endeavoring to impress upon buyers the fact that prices are certain to go higher. Results of this campaign are seen in the increase in inquiries which are being received

There seems to be little doubt but that the log output in northern Wisconsin and Michigan will be decreased this season, due to the unusually mild weather which has prevailed. This is another reason for a probable shortage of northern stocks next spring. Most lumber manufacturing concerns have been making improvements to their sawmills, so that they may be placed in operation just as soon as a sufficient log supply is received. Many men have been thrown out of work in the lumber country because of the mild weather. The situation is said to have been made worse by the fact that some Chicago employment bureaus have been sending men into the Wisconsin woods to work, without any consideration as to whether there was any work for them to do.

The total building investment in Milwaukee during 1913 amounted to about \$13,450,000, but in addition to this sum, two buildings were erected during the year at a cost of \$3,800,000, for which permits were issued

during 1912, but on which the work was done this year.

During the first eleven months of the past year total lumber receipts in Milwaukee amounted to 282,747,000 feet, comprising 237,829,000 by rail and 44,918,000 by water. Total lumber shipments are reported at 75,619,000 feet during the same period, including 21,377,000 feet by rail and 54,242,000 by water.

The Logical Location for Wood-Working Factories

With the scarcity of timber in your locality and the ever increasing demand for higher wages among employees, doubtless you find It difficult in your present location to realize the profits you once made.

the profits you once made.

If you are manufacturing furniture, carriages, automobile parts, barrels and boxes, crates or any product that requires wood, the Southeastern States of Virginia, North and South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee or Kentucky offer numerous excellent openings for any of these lines of business. The greatest supply other timbers are obtainable in nearly every section of the Southeast.

Power is furnished at year reacable rates.

Power is furnished at very reasonable rates while labor is plentiful at a very favorable wage scale. Labor troubles are practically unknown in the South.

Along the Southern Ry., Mobile & Ohio R. R. and Georgia Southern & Florida Ry. are many cities and towns offering liberal Inducements for the location of new industries. We can put you in touch with these parties if you will express a desire.

American Forest Trees

By Henry H. Gibson

Edited by Hu Maxwell

"AMERICAN FOREST TREES" is a comprehensive work of more than seven hundred pages, illustrated by more than one hundred full page pictures of forest types of tree growth, and hundreds of minor pictures.

It answers every question worth asking about the infinite variety of forest growth in this country, and the utilization of these woods in lumber and other forms. The opinion of an

expert on this work is:

"AMERICAN FOREST TREES" is the foremost contribution that has ever been made to American forest and lumber literature.

The price of this work is Six Dollars (\$6.00) net. It will be sent on receipt of price, prepaid, subject to return and refund of payment if it does not prove satisfactory.

Why Worry About Saws—When We Can Bring You Sure Relief?

It's our business to supply you with Saws that will save you worry—that will run longest with least re-fitting—that will make good in every sense.

You have enough to think about anyway. Why be bothered with Saws that crack and lose their points and teeth and tension? Why stop to change Saws oftener than necessary? Keep the wheels going by using

ATKINS STEEL SAWS

It's the quality of SILVER STEEL that gives us the advantage. It's the careful scientific handling from start to finish—the "know how" that means better profit to you if you use ATKINS SILVER STEEL SAWS.

Right now is the best time to try

Atkins Band Saws, Circular Saws, Gang, Drag, Edger or any other kind of Saws

Atkins Cross Cut Saws

are great worry savers. Don't be prejudiced. Don't stand in your own light. Give us a chance to make good with you and don't let anybody tell you that ATKINS SILVER STEEL SEGMENT GROUND CROSS CUT SAWS won't make good. You're the boss. Try it for yourself.

BUY THEM THROUGH YOUR DEALER OR JOBBER. SPECIFY ATKINS SILVER STEEL. IF YOU CAN'T GET THEM IN THIS WAY, THEN WRITE TO THE NEAREST ADDRESS BELOW

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.
VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak. We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

Veneers and Panels with a Reputation

WE manufacture Veneers in all the native woods and for all purposes. Also Built-up Panels in native and foreign woods—three and five-ply—and have established a reputation for furnishing high-grade material. Send us your inquiries and orders and become one of our satisfied customers.

Underwood Veneer Co.

Wausau, Wis.

Custom Mill Work, Storage, Inspection

ON

Foreign Fancy Woods, Mahogany, Cedar, Circassian

We receive the logs, store or warehouse them, manufacture them into lumber, cut or saw veneers, pile and store the product, and ship via any railroad. Also furnish inspection returns on logs or lumber. Can furnish accommodations and economies which it is impossible to secure elsewhere. We always have on our yards parcels of plain and figured African, Mexican and Cuban Mahogany, Circassian Walnut and Cedar logs, placed here for sale by direct foreign shippers, from which advantageous purchases can be made.

W E are now cutting Hardwoods and Hemlock out of big smooth clean prime logs and we give special attention to the making of stock that is hard to make and is required in heavy thicknesses and special widths and lengths. We have now a couple of cars of 6/4 x 10" and wider good tough No. 1 Common & Better Smoky Mountain Ash, mostly better than No. 1 Common and runs up to 24" wide and is ready for prompt shipment. Also Clear Hemlock in all widths and Hemlock in all grades.

We Continue to Solicit the Business of

Discriminating Buyers of High Grade Smoky Mountain Hardwoods and Hemlock

It Tells Just What the Consumers Use

ANY hardwood or veneer man considers his personal knowledge of the requirements of his own trade his greatest asset.

But he realizes that if that knowledge is confined to a limited number of concerns his sales will be the same year after year. Hence to grow he must acquire more knowledge regarding other possible customers.

Do you as a seller of hardwoods or veneers think it is good business to invest years of your time and quantities of your money to gather that knowledge when you can get logically collated first-hand and absolutely live and authentic information on thousands of such consumers and can have the use of it immediately after application?

The cost is nominal and the service is elastic in its form and can be made to fit your peculiar requirements exactly. Write now and get the benefit of the annual corrections.

BAY CITY, MICH.

THE HARDWOOD GATEWAY OF THE SOUTH

You Can Get It In Louisville

If you need anything in the line of hardwoods, including veneers and panels, just remember this: You can get it in the Louisville market.

You are doubtless familiar with the reason: varied stocks, co-operative methods and geographical location explain our secret of serviceability.

Meanwhile, look over the appended offerings, pick out what you want, and write to the concerns interested. If you can use a few thousand feet of several items, offered by different concerns, they will be glad to load a mixed car for you.

A floor to adore

For thirty-three years Wilce's Hardwood Floorland because it stands today "inequaled" is the
best evidence that its manufacturer has kept
abreast of modern methods and the advanced demands of the trade. To convince yourself of the
above statements, try our polished surface flooring, tongued and grooved, hollow backed, with
matched ends and holes for blind nailing—you'il
find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is fre

The T. Wilce Company

22nd and Throop Sts. CHICAGO, ILL.

OUR DOUBLE BAND MILL HUTTIG ARK

Why We Can Give "Value Received"

We own one hundred thousand acres of the best virgin
Southern Hardwood timber.

We operate large band mills at Huttig, Ark., and Deering, Mo.

We cut FORTY MILLION feet of hardwoods annually and carry 15,000,000 feet IN STOCK.

We sell only stock cut on our own mills and so can GUAR-ANTEE the quality of EVERY shipment.

We ship high grades that increase the size and percentage of your cuttings, reduce factory costs and shrink the waste pile. Therefore:

We can SAVE YOU MONEY on every shipment of oak, ash, gum, elm, cypress, tupelo, hickory, cottonwood, sycamore, soft maple and dimension.

LET US PROVE THIS ON YOUR NEXT ORDER

Wisconsin Lumber Company Harvester Bldg. CHICAGO

Close Application

To the study of the source of supply, manufacture and merchandising of

Circassian Walnut

has resulted in our carrying not only one of the biggest but a remarkably well assorted stock of that line of veneers, and it is only logical that we can take care of any order, no matter what the peculiarity or proportions.

A member of our firm personally bought a fine lot of mahogany logs at the Liverpool sales in October, which we are now cutting. The natural supposition is that this stock is right. Now ready for your inspection.

Review and Outlook

General Market Conditions

THE VARIOUS CONVENTIONS that have taken place in the last two weeks have developed an excellent indication of the present and promised condition of the lumber business. Without exception, the tone of all of these meetings, embracing both northern and southern operations, has been soundly optimistic. By soundly optimistic is meant that there has been no tendency to view the situation in the light of a boom, but all expressions regarding the present and immediate future of the lumber trade indicate that there will be an apparent, though conservative and entirely legitimate, improvement in the situation. In fact, summing up the opinions of some of the biggest men in the trade, men who are closely in touch with economic factors which have a direct bearing on the lumber business, 1914 promises to be one of the biggest trade years on record.

The encouraging sentiments expressed are based first on the improved tone of business conditions in general which are the result of the settlement of political questions at Washington and the assurance that has been given to business men that the administration will not interfere with legitimate business enterprise and development. With this assurance, business men have taken new heart and have for the most part overcome the mental depression which has been evident for several months. This has naturally reflected directly upon the lumber business, in that it has affected the demand for the products made from lumber and hence the demand for lumber itself is strengthened.

This condition is supported by a really favorable status of stocks at both mills and consuming points. As far as the mills are concerned, both in the North and the South, the stock situation is very favorable, while it is a generally conceded fact that the stocks on consumers' yards have not been so light for a long time.

It is true that a recent report coming from northern manufacturers states that their stocks are heavier than at the beginning of 1913, although lighter than the year before that. But it must be remembered that last year stocks of northern operators were too light even to fill the ordinary demands. Hence any reasonable inquiry this year is rather favorable than unfavorable, as it will unquestionably develop in the course of the next few months that the call for northern products will take up all available stocks. Regarding the South, it is impossible to view stock conditions there in any other light than that stocks are really below normal. In fact, some large operators say that while they have carried as much as 30,000,000 feet of dry lumber on sticks they now have only 4,000,000 or 5,000,000 feet. Furthermore, it is promised that there is little likelihood of there being any accumulation over present stocks, as logging condi-

tions have iib't been unduly favorable, and it is expected that increased demand will take care of any increase in output.

It has been stated before in these columns that the larger stocks are in strong hands and are being held for improved prices. This is an absolute fact. The larger operators have expressed themselves very vigorously on this score and it is generally anticipated that the owners of the bulk of the southern hardwoods are strong enough financially to refuse orders of any dimension for future shipment. They are willing to take care of the trade for the present, but will not contract for any large deliveries ahead. In fact, one of the largest operators in the South made the decisive statement a short time ago that he had realized \$1.60 more on an average for his lumber during 1913 than ever before, and that if his lumber did not bring him a \$2.00 increase this year on the general level, every stick of it would stay in his yard. This particular man is in an excellent position to carry out this suggestion, as are many others who have expressed themselves similarly.

Looking at business on the broader basis, the country is in really sound condition. The money situation has been very materially improved and it is now possible to secure necessary funds at normal rates. A great deal more money has been placed in circulation during the last few weeks. In fact, it is reported that for the three weeks of January banks reported greater deposits than for any three weeks of 1913. This is going to very materially aid industrial development and industrial investment throughout the country, as well as to assist in the general restoration of prosperous conditions and the resultant broadening of the market.

The various woods show a proportionate improvement, with the greatest strengthening in the upper grades. Quartered oak is still a strong factor and it is reported that plain oak is showing a noticeably increased demand. It cannot be said that the gum situation has improved very much, although there is proof that such an improvement is anticipated in the near future. As an instance, one large manufacturer recently turned down an order for 1,000,000 feet for future delivery and advised its customer that it would take care of its immediate requirements, but had entire confidence in an improved condition in the gum market during the next few months. This sentiment is apparent throughout the gum-producing section.

Summing up, the general sentiment seems to be that business looks good but that business men should not soar too high from the ground, but maintain a level and conservative position, there being a practical assurance that a healthy and satisfactory improvement will be consistently and continuously evident in the situation for some months to come. In fact, it is sanely and sincerely predicted by a great many of the most conservative and most successful lumbermen of the country that 1914 will be one of the biggest years in the history of the lumber business.

Cabbage Palmetto

THE HALSTRATION ON THE FRONT COVER of this main ther of Hygorogo Ricord gives a characteristic view of a torest of abbage palmetto in Florida. The location is near Atlantic Beach, about eighteen miles from Jacksonville. The photograph was turnished by the J. C. Turner Lumber Company of New York. This company is financially interested in the well-known winter resort at Atlantic Beach.

The palmettos receive much praise for their beauty and many imprecations on account of bad qualities. It is despised by surveyors, hunters, lumbermen and others who travel on foot through jungles of palm-like growth with sharp-pointed leaves which stand out like porcupine quills. But the jungles which torment most are not the cabbage palmetto but the smaller species appropriately named "saw palmetto." This pest seldom grows tall enough to lift its leaves above a footman's face, but just high enough to jab him. The cabbage palmetto is quite different. The trunks rise year by year until the massive crowns are lifted high in air, and a grove becomes beautiful and park-like.

The tree is confined principally to the southeastern coast region of the United States. The northern tourist who is taking his first journey south, following in the vicinity of the Atlantic coast, will first make the acquaintance of the cabbage palmetto in the Carolinas. The tall trunks are smooth and of a reddish color which suggests sole leather; but the trunks of medium height are usually criss-crossed like basket-work. The latticed appearance is due to fragments of leaf stems which adhere to the bole long after the leaf has broken off and fallen. The lattice disappears in time, and smooth trunks are a work of age. The picture shows no young trunks.

A cabbage palmetto tree consists of three interesting parts, two of which are seldom seen by the tourist or casual visitor because they are completely hidden from sight. The three parts are the root, the stem, and the bud. The bud is at the top of the trunk and is called the "cabbage" -hence the tree's name. It is cooked as a substitute for cabbage, and though many persons sample it, through curiosity or otherwise, few acquire a real liking for it. A novice has trouble in finding the bud, and after he has succeeded in locating it, he is likely to be baffled in his efforts to extract it, because it is buried under fold after fold of tough bark, and a sharp axe is the best means of cutting it out. The bud is the origin of the leaves, not of the fruit. In fact, the fruit of the palm is small and worthless, being black and of the size of a pea. About the only creature of animated nature that will eat it is the bronze, razorback Florida hog, and he seldom gets a chance, because the fruit hangs until it dries up and blows away, and although the hog of that region is quite an active varmint, he cannot jump high enough to pick the fruit.

The long, graceful trunks of the palm are admired by all who see them-after they have cast off the ragged basket-work which covers them in youth. The stems usually rise perpendicularly until they become so tall that the weight of the foliage at the top causes them to careen. When once out of plumb they are seldom able to recover their upright position, but bend more and more until finally the crown nearly or quite touches the ground, forming a curve dear to the eye of the mathematician.

Unfortunately, the cover picture shows no careened bole, though such are very plentiful in the old palmetto forests of Florida. It does, however, show a very interesting leaning tree which lodged against another. The reason why that tree leans at a sharp angle instead of the characteristic curve is an interesting consideration, and in order to understand it, the root must be examined.

The root of a cabbage palmetto tree is a wonderful piece of mechanism. Architects call such a device a "floating foundation." This palmetto usually occupies soft, swampy ground which affords poor anchorage for roots, and nature took extra precaution to make things secure. The large roots form a round mass, like a ball of three to five feet in diameter, deep down in the mud. The trunk stands nicely balanced on this sphere whose

principal function seems to be to sustain the tree and prevent its sinking by its own weight deep into the plastic mud.

However, there must be additional support. The ball can keep the tree from sinking endwise into the mud, but cannot prevent it toppling over. To remedy this defect, a multitude of long, slender roots radiate from all sides of the ball, penetrating for ten to twenty feet into the soil and serving as that many guy ropes to hold the tree erect. So strong are these stay roots that the tall trunk may careen until its top touches the ground without breaking them. The bole bends but the roots will not snap. An occasional exception, however, should be noted, and it happens that such an exception appears in the picture. The leaning trunk referred to above has pitched over and would have fallen flat had it not lodged against another tree. The anchor roots broke, else the tree would have assumed a curve instead of keeling over. In almost every instance where the tree falls it is because of decay of the roots which permits them to break. The tree that falls is generally dead or nearly so before it goes down.

A Timber Tax Precedent

THE PROPER APPLICATION OF THE INCOME TAX to lumbering operations has caused more or less uncertainty on the part of manufacturers, and a recent opinion secured from the treasury department not only clarifies this subject, but also establishes a precedent seemingly indicating that in the opinion of the treasury department the only logical and fair way of taxing timberlands is when they are converted into the salable product.

The treasury department says that the gain from cutting and disposing of stumpage is realized in the year during which the timber is cut and disposed of, and the amount received in excess of such cost of such timber is profit and should be so counted as income for that year. It is further understood that no timberlands will be subject to tax until the timber is cut and marketed. and then only the profit, after the cost which will include protection of the growing timber is deducted, will be subject to an income tax assessment. The latter feature in the treasury's opinion is the one that has a broad bearing on the determining of timber taxes

It would seem that this really establishes a precedent that would make it imperative that all tax systems pertaining to timberland assessments should be based on the value of product when cut. It would seem that this opinion opens a loophole through which timberland interests can successfully wage a country-wide battle against present unfair taxing methods.

Regarding the Uniform Bill of Lading

VARIOUS TRADE ORGANIZATIONS of late have entered emphatic protests against the time limit of filing claims under the proposed uniform bill of lading now being considered by the Interstate Commerce Commission. A prominent association directly connected with the lumber business has made a very fair and sensible plea that the Interstate Commerce Commission extend the time limit from four months to twelve months. The plea is based on the fact that the short period of four months would absolutely operate as a burden to manufacturers in that it is too short a time to secure evidence in the majority of complaint cases, and that even a year is none too long a period. It is pointed out that manufacturers as a rule are not desirous of rushing to the railroads with claims, and do so only after exhausting all other efforts to adjust matters with the consignee. Too frequently manufacturers know nothing of any damage to goods for months after shipment and are made aware of it only after attempts are made to collect bills. After that consignees are slow in sending evidence, and to limit the time to four months would absolutely debar most of the claims,

Talks with railroad freight representatives bring to light numerous cases in which this very condition is decidedly apparent. Such stories are very common and considering the circumstances with which they are surrounded, and the fact that they describe actual occurrences, they offer ample proof of the fairness of the claims made by numerous shapp is regarding the time limit on railroad claims. The Interstate Commerce Connession will do well to maintain its reputation to entire fairness it it grants this plea.

The Logs or the Finished Article?

EXPORT FIGURES covering torest products in the Unite-States show that a large sum is invested annually in American hardwood logs on the part of importers from various countries across the water. In most cases these logs go into products which American manufacturers are well equipped and well qualified to manufacture themselves. In selling the product of the American hardwood forests in this crude form, American business men as a whole are not realizing the actual return value they should realize from supplying the foreign market with the finished articles made from these very logs.

It will be argued that manufacturers abroad can turn out these products at a less cost than American manufacturers producing them, and also that the foreign manufacturers are peculiarly qualified to take care of their particular trades and can ward off competition from abroad because of their intimate knowledge of the trade to which they cater.

Granting the low cost of manufacture abroad, it has been proven that this point can be easily met by superior efficiency, which as a rule prevails in this country. Regarding the other point, if this argument were discussed, it would probably be merely an excuse for the absence of proper endeavor to secure this trade, which should rightly be part of the business of the American manufacturers. The Canadian government has levied an export tax on pulpwood in order to increase the manufacturing establishments turning out wood pulp in the dominion. It would not be necessary to place such a tax upon export logs to enable the American manufacturer to get the benefit of the increased profit resulting from the sale of the finished product, but it is necessary that the foreign market should be closely analyzed by American manufacturers of products made from wood with the idea of gradually taking over this market unto themselves insofar as it is directly connected with the various species of Ameri ran woods.

The market is there and the ability to fill the market also. It is needless to say that the effort to secure the market exists, but while some inroads have been made on the trade of foreign manufacturers, this latent ability is more or less predominant and American hardwood logs will continue to be exported so that the cream of the profit may be secured by manufacturers abroad until American manufacturers of such products fully realize the possibilities in the situation.

Eastern and Western Forests

MANY LUMBERMEN ARE ENPECTING that the opening of the Panama canal will remove the barrier which has stood in the way of marketing the eastern and the western woods in certain large regions. The lumber dealers in the East and in the West share in this hope. It is expected that the cheap western softwoods will find profitable markets which they have been unable to reach in the past because of high freight charges over the available routes; and the expectation is equally strong that eastern hardwoods, either as rough lumber or in manufactured articles, will be carried to western markets at rates which will assure the manufacturer and dealer a larger share of profit than has been possible in the past. Time must test the reasonableness of these expectations.

The forests of the Pacific slope are almost exclusively softwoods, and much of the timber is of splendid quality. The eastern forests are both hardwoods and softwoods. The hardwoods in the Mississippi valley and east of it have been estimated to aggregate 400,000,000,000 feet. A single softwood of the Pacific coast, Douglas fir, considerably exceeds in quantity all the hardwoods of the United States.

There are western demands for eastern woods and eastern

markets for western woods. Business men expect freer exchange when the canal is opened. A thousand miles of practically treeless plains and mountains separate the forests of the eastern part of the country from the western.

The geographic separation of those widely different forest regions has existed during an immense period of time. What is now the nearly treeless belt extending from Canada to Mexico was once a sheet of water connecting the Gulf of Mexico with the Arctic occan. The separation of the eastern from the western forests dates from before that time. There were then two continents instead of one, and the eastern continent's forests were different in composition from the those of the West. In the East there were yellow poplars, red gum, sassafras, sycamore, elm, and many other hardwoods which still grow there; in the West were the softwoods which to this day hold undisjuted domain.

The separation existed long prior to the Ice Age, and it has continued practically unbroken ever since. When the sea withdrew from the central part of the continent, a semi-axid region took its place, and neither the forests of the East nor of the West could spread across it to mingle their species in common. A few, the cottonwood, juniper, and white spruce, succeeded in crossing the axid belt, but most others could not, and they remain separate today as they were in the Cretaceous Age when an arm of the sea divided them.

It may be of interest, though not now of practical importance, that when the eastern part of North America was separated by water from the western, there was no Isthmus of Panama. The Pacific ocean was joined with the Atlantic by a deep wide channel, and what is now the whole Panama region was then seabottom.

Dr. Rothrock's Resignation

THE RESIGNATION of Dr. J. T. Rothrock as a member of the Pennsylvania State Forestry Commission, for the reason of "advancing age," is an event of more than momentary importance to the cause of forestry in this country. He was one of the first men to take hold of this work and he has devoted the best part of a long life to it. He has been to forestry what Benjamin Franklin was to popular government-founder, expounder, and a long, faithful, and practical worker. He was planning and executing long before the mass of the American people had heard of forestry. He can be classed with that few of whom it has been said: "They, while their companions slept, were toiling upward in the night." Dr. Rothrock is a botanist of rare attainments. Knowledge of the range and characteristic of many of our forest trees have been greatly extended through his personal work in nearly all parts of the United States. During many years he has been a contributor and one of the editors of "Forest Leaves," a small, four-page periodical which has contained more practical and accurate information concerning American trees than any other publication of like size ever given to the public. It is to be regretted that he feels that age makes his resignation necessary. Yet, he has not laid down the armor until he has seen the battle won. The movement has now gained such momentum that it no longer depends for success upon the efforts of one man or a few men. Fortunate it is, therefore, that this Apostle Paul of American forestry can retire with the assurance that he has "fought a good fight."

Progress of the Age

A RECENT BULLETIN issued by the University of Wisconsin, commenting upon the work being done at the Forest Products Laboratory at Madison, Wis., in connection with the torestry department of the university, after reviewing the work in detail, contends that the question of utilization as a great waste in our forests and in our lumber mills is dealt with in part by the development of distillation. It then goes on to tell briefly of the results aimed at in connection with the various wastes in the forest and at the mills.

In conclusion it says that: "And what does all this work

mean? It means that we are awakening to the fact that our forests our mighty oaks and firs are one of the nation's greatest assets, 'Expert' and 'efficiency' are two words that have found their way into the language of trees as well as into that of business."

It is true that this awakening has at least started. It is as vet really a more something in the air and its actual close applieation in practical operation is so far but just begun. It is indeed gratifying to review the work done aiming at scientific utilization of our forest products and the scientific preservation of our forest supply inasmuch as the really marvelous progress which has been made in the last decade is a fitting evidence of the vigor and intelligence with which the American business man attacks a subject when it is definitely brought to his attention. This work is not being carried on purely by theorists, as it has the moral support, at least, of the practical and farsighted lumber

Various influences peculiar to the lumber business have resulted in a great many of the more conservative members of the trade withholding any visible support to this movement looking toward a more scientific administration, but these conditions have changed and now even while the actual visible support in this country does not cover the entire industry, it is certainly a fact that the lumbermen as a class realize the importance of fostering these efforts. With the trade behind this research work, the result cannot be in doubt.

If This Is True, Why Mahogany?

NSTANCES ARE NUMEROUS illustrating the lack of any definite knowledge pertaining to the lumber business on the part of those interested in issuing the daily press of the country. This is true not only of the staffs of the city dailies, but more surprisingly it is true of the editors of such small country publications as are published in towns essentially interested in the lumber business. A dispatch came recently from such a publication located in a town in Michigan that is in the center of a vast lumber producing region. The dispatch tells of the value of forest growth in that particular section of Michigan and then says "We don't know what is to be done with it, but birch as a finish commands as high a price as mahogany."

It does not constitute a disparagement of birch nor offer any information that is not already well known when it is stated that this sentence is of course utterly ridiculous. The point is that it is to be deplored that the daily press of the country is not able to secure more accurate information regarding the products of such a vast business as that of manufacturing lumber.

A Wrong Policy

IT HAS BEEN SUGGESTED in the past by men prominently concreted with the manufacture and marketing of red gum that that worthy wood would make much better progress in its development as an important American hardwood if the name of "red gum" were relegated to the scrap heap and some more fancy appellation supplied, HARDWOOD RECORD has contended that such a policy would be a serious mistake and as the wood becomes better known this mistake would, in the opinion of HARDWOOD RECORD, be increasingly serious.

The question has recently come up again, however, on the suggestion of a certain group of southern manufacturers who have listened to the idea of a prominent advertising man. In the first place to connect red gum at this stage of its development with an entirely new name would mean that all the efforts so far used in introducing this wood would be wasted and would have to be repeated in order that its present position might again be reached.

In the second place the discontinuance of the real and commonly accepted name "red gum" would constitute an admission that the grave charges against this wood which have existed in the past were charges of an entirely substantial nature which could not be remedied. Such a policy would have the effect of creating the impression that another wood was about to be foisted upon the public, and then if, due to mistreatment of any kind, the old objectionable characteristics cropped out on occasion, the new wood would get the full benefits of these characteristics and the good qualities would not be considered.

On the other hand, great strides have been made in effecting methods of manufacture and handling gum, and as a result this wood is today put on the market in most acceptable form. These changes. however, have been made in the handling of red gum and are generally recognized as having been effected with that wood. Therefore to arbitrarily change the name of the wood would mean that the confidence so far instilled would be rendered null.

Red gum should not be a substitute nor should any other name than its own be substituted for it. It is fundamentally able to stand on its own legs if properly treated, and to attempt to rob it of the increasing favor with which it is being considered at this stage of its development would be injustice, to say the least.

What a Lumber Club Should Be

DEFINITIONS OF WHAT A MODERN LUMBER CLUB is and what it should be, are, it must be confessed, very frequently very divergent. While the national and state associations are accomplishing a vast amount of good and are really effecting measures and conditions which mean monetary gain to their members, the local clubs, which actually have a better opportunity for accomplishing things that touch the lumberman closely personally, have in many cases overlooked their opportunities. The old idea of club meetings is still very much in evidence in a great many large sections, and this idea seems to have been that the sole purpose of these meetings was to get together and have a good "feed," a few drinks, swap a few stories and then go home-or elsewhere.

However, encouragement for the future is seen in the really live activities of some of the municipal organizations now in existence in various parts of the country. In most cases this change in effort has been the result of the ideas and efforts of some one man or some group of men, but nevertheless it is working out and is continuing to develop. It is hoped that the city organizations, the clubs and associations will all come to realize eventually the wisdom of following a course of this sort, the result of which will be a very material benefit in many ways to the individual members, and these benefits will be of such a nature that they can be actually seen and appreciated, simply because the questions will be so closely associated with the members themselves that when the results are accomplished they will be altogether obvious.

A Complaint Against Tupelo

BRASS MANUFACTURING COMPANY in Connecticut re-A cently complained because a trial shipment of tupelo or bay poplar was proving unsatisfactory for boxes and crates. Investigation showed that a very poor grade of material was being used, lower than the ordinary boxing. The manager of the wood department of this company is very anxious to conduct his branch of the work as economically as possible and is constantly experimenting with new materials in order to effect a saving. The price quoted for the tupelo f. o. b. his station was about one-third lower than that of the wood he had been using. The material received is, however, of such poor quality, being warped, rotten and otherwise defective, that it is giving no end of trouble and the operators are looking forward to the time when the shipment will be exhausted.

This is unfortunate, as it gives tupelo a bad reputation which it does not deserve. The regular boxing grades would doubtless have given good satisfaction, and trial shipment of such lumber at a higher price should have been made. Then if the buyer felt that this wood was not as economical for his use as some other wood, his refusal to buy more would not have been because he considered tupelo worthless. If the salesman who was anxious to establish a market for tupelo had been more familiar with the requirements of the brass company he would not have shipped him the stuff he did. The associations which are making efforts to boost the consumption of their products will make a serious mistake if they do not recognize the limitations as well as the merits of their product. A dissatisfied customer will neutralize a whole pot of printer's ink.

Pert, Pertinent and Impertinent

THE CONVENTION SEASON

If I attend all these conventions how in the mischief am I to have time to do any business?

Never judge a man's line of thought by the

talk he lets out.
The average married man often wonders how his wife can have so much faith in him.

Some women can look swear words just as forcibly as some men can say them.

Worry is a confession of weakness, but that thought does not help much.

It's too bad that when a man puts his foot in it he is not in a position to kick himself. Some good people manage to be happy even if they are lonely.

It's difficult to believe that practice makes perfect after listening to the chap who practices on a cornet.

The man who boasts of calling a spade a spade may pass a snow shovel without being able to recognize it.

Meeting Michigan Manufacturers

The instrumenting of the Michigan Hardwood Manufacturers' Association was held at the Pontchartrain Hotel, Detroit, Wednesday, January 21. In the absence of President F. L. Richardson First Vice President C. A. Bigelow presided. Forty firms were represented and much interest was manifested in all of the subjects under discussion, and a general optimistic feeling, as to the outlook for the coming year, prevailed throughout the entire meeting.

Secretary Knox's report was read, approved and placed on file. The report follows:

1912 was one of the best years for the manufacturing lumbermen of Michigan and the year 1913 has in many points equaled it. We started in the past year with every feeling of confidence for a successful year and I believe most of the manufacturers consider the past year to have b en above the average and we are looking for a good year for 1914.

Our stock reports, with the same number of members reporting as onyear ago, will show more stocks on hand than a year ago, but less than

Our general assessment levied at the October meeting has netted us \$7.828.51 on basis of 391.428.946 feet at 2c per thousand. There are still three members to hear from and we have had the promises of their paying the amount due us at an early date.

Our treasurer's report shows a net cash balance in the general fund of \$8,615,58 and in the forest fire fund \$1,648,25. There is still one assessment in the latter fund due, which we expect to get later on.

The secretary's office has been reporting recent sales from cargo and ear shippers by circular and we are informed that this work has met with approval at your hands. We are pleased to give this information out for the benefit of the general trade and are open to any suggestions along this line of work.

We are pleased to report that we have at last received something definite on our Pacific Coast rate case, which we started four years ago. We have an order from the Interstate Commerce Commission covering reparation on 289 cars amounting to \$6,890.11 and this is ordered paid by February 15. This amount does not cover all the cars presented and we are looking for an additional order covering other shipments.

The question of Michigan lumber rates is still before us and has not yet been settled. I believe a conference of the railroads, shippers and the State Railroad Commission would do more to bring about a better understanding between the shippers and carriers, than anything that could be done. Our railroad committee has handled this matter very judiciously and Chairman Ballou will have a report to make before the

One of the topics announced in our call for meeting was "Logging and Camp Expense," and it is believed that something to the benefit of lumbermen could be gotten out, through a conference on the subject. The Northern Hemlock and Hardwood Manufacturers' Association some time ago formed two new committees; one upon standardization of logging accounts, and one upon the welfare of men in the camps, both of which are well worthy of consideration and if properly handled can be made of much value to the members

The treasurer's report indicated a good balance on hand in the general fund and also in the forest fire fund.

Five new members were enrolled at the meeting: The North Western Cooperage and Lumber Co., Gladstone, Mich.; The Spies-Thompson Lumber Company, Menominee; The D. N. McLeod Lumber Company, Garnet; The W. R. McManus Lumber Company, Petoskey; The Strable Manufacturing Company, Saginaw.

Chairman Ballou of the railroad committee then submitted his report, which was accepted and placed on file. It stated that the Michi gan Hardwood Manufacturers' Association has filed protests with the State Railroad Commission against the proposed canceling of the lumber commodity rate, which would put lumber under the proposed sixth class rate. Information was furnished the State Railroad Commission to show the effect of the change on the cost of shipping lumber within the state. An examination of the previous year's shipments by a large number of lumbermen disclosed the fact that the proposed change in rates would amount to an increase of from seven to sixty-eight per cent in the cost of shipping lumber. The average increase amounted to twenty-four per cent.

When this matter and the data backing it up were brought to the attention of the railroad managers, they were convinced that the announced change was inopportune, and they made it known that there was no serious intention of putting the rates into force. However, the protests remain on file with the State commission, and their presence acts as a bar to the filing of notices of change in rates by the railroads. It is now the plan of the association to call a conference early

n February, and have representatives present from all the railroads at interest, as well as from all the lumber shippers in the state. It is believed that a conference can be had whereby the lumber shippers and the railroad companies can agree upon a basis for lumber risks, so that the protests can be withdrawn and the railroad companies permitted to file rates that will be agreeable to their patrons.

The railroad committee of the association has employed R. R. Darwin as an attorney to act for the association in these hearings before the State Railroad Commission,

Fred A. Diggins had no report to make for the legislative committee, but expressed in a few well chosen words, his appreciation of the thoughtfulness and good will of the association during his illness a year ago. He urged the members of the Michigan association to remain loyal to the National Hardwood Lumber Association.

The absence of Bruce Odell, chairman of the market conditions committee, was noted. In his absence John C. Ross, of Bay City, read the report which follows:

From stock reports received your committee believe that ash basswood, birch and elm prices should remain about the same as at present but that beech and maple should rule higher. To some of you it may not seem advisable to change prices at this time, but we believe that the growing demand for beech and the prices it has been selling at fully justify an advance. We think maple should rule higher as it is a wood that is being more generally used and the supply is becoming less every year and can be had in quantities only in Michigan and Wisconsin and if there is any wood on which we should be firm and should get befor prices for, we think it is maple, as to a large extent Michigan and Wisconsin produce the bulk of this wood.

Oak, which is maple's nearest competitor, brings much higher prices. especially is this true of the thick, which is used for practically the same purposes

We think the manufacturers will have no trouble in getting the recommended prices this year, as while general business may not look so good to some, we must remember that the bardwood situation is very firm, and that owing to the open winter, up to the present time, the output for the coming year is going to be curtailed considerably.

Recent sales reported to this association since January 1 indicate a much heavier demand than for the preceding sixty days. The reports also show that some sales have been made at an advance of last year's prices.

In regard to hemlock: While we would not recommend a change of prices at this time, we think the market is very firm, with the prospect of an advance in the near future. From reports received, there will be about 20,000,000 feet less put in this year than last.

Latb are firm at present prices, with a very small stock on hand.

Chas. F. Hickok, chief warden of the Forest Fire Protective Department, read his report which outlined the proposed work for the coming season.

On motion, the time for deducting the cut on lands from the list of those patrolled, was limited to March 1, 1914. Two observation towers, recommended by Mr. Hickok, were authorized at an expense not to exceed \$200.

Then followed a general discussion along lines relating to the emplovers' liability act-various members recited their experience on different phases of the law.

A committee consisting of Bruce Green, F. L. Michelson and W. C. Hull, was appointed to look into the subject of standardization of logging accounts and make a report at the next meeting of the association in April.

Then followed the announcement of the status of the association's cooperation in the Forest Products Exposition. The Michigan Hardwood Manufacturers' Association will unite with the Northern Hemlock and Hardwood Manufacturers' Association, covering the upper peninsula of Michigan and Wisconsin in a joint exhibit to be shown both at Chicago and New York. Plans which have been pretty well matured provide for a modern bungalow of reasonable price but of comfortable design and equipment which will be made, trimmed and furnished throughout, as far as woodwork and woodenware and concerned at least, with products of the forests of Michigan and Wisconsin. Different rooms will be trimmed in different woods and different types of furniture will be shown illustrating the excellent effects that can be gotten from working in northern maple, birch, beech, elm and similar woods.

The meeting then adjourned.

Hardwood Manufacturers' Annual

The twelfth amount in contrast to the Globel Man to the second of the Trend States, the total Hotel Gaves. Memphes, Tenn., Wednesday and Trens to the Trend 21, non-tool that that association is in an unusually prospectors condition and that the membership and interest displayed in its accomplishments and its efforts are constantly gaining ground.

The meeting was attended by about 600 representatives of the lumber trade from various parts of the country and in addition there was a goodly percentage of a series who attended a a body in the interest of their business.

The business sessions of the meeting were started about eleven o'clock on Tuesday morning, the opening session being very well attended, practically every seat being taken in the large hall provided. This can also be said of the two other sessions which followed.

C. M. Bryan, representing the city of Memphis, opened the session with a very eloquent address of welcome, in which speech he demonstrated to the entire satisfaction of all those present that the city was mighty glad to have the opportunity of extending its hospitality to the visiting lumbermen. Mr. Bryan in his talk told of the provisions which had been made for the comfort and entertainment of the visitors and elaborated somewhat upon the noted hospitality upon which those in attendance were invited to call during their stay in the

Mr. Bryan was followed by J. M. Touther, secretary of the Memphis Business Men's Club. Mr. Touther stated that he spoke for the president of that organization, who was at the last minute compelled to be absent from the city. He seconded Mr. Bryan's cordial welcome, speaking more specifically for the business interests, and closed his address with a suggestion that the association use its efforts to secure a regional reserve bank

for the city of Memphis under the recently enacted currency bill. The third address of welcome was delivered by J. D. Allen, president of the Memphis Lumbermen's Club. Mr. Allen gave every assurance that members of the Memphis trade, being lumbermen themselves, are fully aware of the requirements of a gathering of lumbermen and had made every provision to amply take care of these requirements. He assured the visiting lumbermen that if there were anything at all that the local trade could do to still further cater to their comfort and enjoyment while in the city they had only to make those wishes known and they would be promptly take care of.

R. L. Hutchinson of the Hutchinson Lumber Company, Huntington, W. Va., responded to the various addresses of welcome on behalf of

the association. Mr. Hatch is on proved himself an a ator of the first water and his definition of the south and its importance, purposes and meaning was very well received. He expressed deep approciation of the southern section of the country, of the city of Memphis and, speaking more broadly, of the character, ability and integrity of the average American citizen. His talk was a fitting expression of appreciation of the hearty welcome accorded the visitors by members of the Memphis trade and of the citizens of that municipality.

ers of the Memphis trade and of the crizens of that management.

President W. E. DeLaney then read his very able annual address.

It would seem that those attending conventions would lobby than to sit in a hall to later read at their leisure in the trade postnass. With to show nent is to be derived by nameling with one another at conventions. I feel that more good is to be gotten out of the actual work at the meetings. It was with this in view that we intentionally prepared a short program, hoping that questions of interest to our business would by discussed on the floor by those present and in that way give each the benefit of the others' ideas. We may not succeed at this time in getting the general discussion desired, but I believe it is a step in the right direction, and I trust that in future conventions matters will be more freely discussed on the floor than heretofore.

One moment with the past, which does not interest us except as a guide for the future. General business conditions in the past have not been satis-Bradstreet reports that 1913 was the third worst year in numbers, and the fourth worst year in liabilities, of which there is record in the past third of a century. ber failures increased 5.3 per cent in numbers, and 46 per cent in the amount of liability over that of 1912. We were faced with labor troubles, political agitation, and toward the latter part of the year financial stringency. The lumber business was good the first half of the year, the third quarter fair. and the last three months poor.

E ASSOCIATION

At present business is not satisfactory. As is usual at this season of the year, business people are taking inventories, closing their books and planning for the coming year's

Stocks are less than normal at producing points. In the consuming markets stocks are low and any revival demand will be immediately felt by the manufacturer.

The strife between capital and labor so bitter last year has settled at least temporarily a good portion of these troubles, and I anticipate less labor trouble this year than formerly.

It is generally agreed that the recent currency legislation will do much good, and this with the tariff legislation out of the way should assist materially in bringing about better business conditions. I believe that the day has passed when fortunes can be made over night in speculating in stocks, bonds or securities, but I am a firm believer in the natural resources, energy and integrity of the American people, and I believe

JOHN H. HIMMELBERGER, CAPE GRARDEAU, MO., NEWLY ELECTED PRESIDENT OF THE ASSOCIATION

B. B. BURNS, HUNTINGTON, W. VA. TURST. RALPH MAY, CINCINNATI, O. SECOND VICE. C. M. CRAWFORD, COAL GROVE, O., TREAS-VICE PRESIDENT. URER

legitimate business ventures will in future reap as great, if not greater, rewards than they have in the past. This country with its wonderful resources can recover quickly from a depression, and this may occur in a day,

The weather is a factor in our business as in other lines. The open winter has afforded better logging conditions in the mountains than the average, but worse ones in the North and parts of the South.

I think in the production of lumber we should proceed with caution. It is certainly no time to expand our operation for the purpose of increasing our production. Increased production may slightly lower the manufacturing cost, but will decrease the selling values more than is saved in the manufacturing cost. While there is still room for improvement, and we have spont a great deal of time, thought and money in an effort to lower the cost and improve our manufacture, it occurs to me that we have not made as much advancement in the method of marketing our lumber as we have in its production.

If our manufacturing cests were increased in the course of a month \$2.90 per M. feet we would immediately have every foreman on the job on the carpet, fully convinced that our business was being improperly managed. How much more easily do we pass a cut of \$1.00 to \$2.00 per M. feet in our selling price, being satisfied with the statement of the sales manager that it was necessary to meet competition.

In my opinion the time has arrived when we have buying seasons in lumber as there are in other commodities. For the past few years there has been practically no business placed in July and August, yet that appears to be the time when we work our salesmen hardest, the result of which is procuring practically no business, but which has a tendency to hammer down prices. I believe the sooner we recognize this fact and keep our salesmen off the road during these two months the better will be the result. If they are good salesmen give them a vacation; if poor ones take them to the mills in an effort to make real salesmen and not order takers out of them.

If the lumber is to hold its place in the commercial world, modern methods as used in other lines must be followed by ours. A few years are we felt secure that with the diminishing supply of standing timber the time would never come when the demand was not equal to the production. When substitutes for lumber began to make themselves felt we laughed at the efforts of their promoters and said the public would always want all the lumber that we could possibly produce. We made the same mistake that was made by the railroads and express companies, who did not cater to public opinion. Today the mails are full of literature from these companies with a view to modding an opinion favorable to them. Only the other day I received (as no doubt did many of you) a pampllef issued by the American Express Company marked "From the president's office," setting out the growth of the express business, what they were endeavoring to do and have done for the public, also how reasonable are their charges as compared with the service given.

An article in the Saturday Evening Pest of December 26 entitled "Every Man's Castle" shows the vigorous effort being made to sell substitutes of lumber for building purposes. There is no disputing the fact that the market for lumber has been scricusly encroached upon by steel and concrete substitutes, and the day has arrived when we must face this competition. A part of this substitution was absolutely necessary and cannot be successfully combated. There is, however, an open field where lumber has merit over substitutes, and it is this field that we must strive to retain. In order to do so it will be necessary for us to increase our efficiency in the marketing of our preduct.

What opinion does the public hold as to the lumber industry? I believe that the public feels that the timber of this country is so nearly exhausted that it is only a question of a very short time until it will all be gone.

or so high in price as to make its use prohibitive. It is also the erroneous belief that all lumbermen are wealthy and there is nothing but profit in the lumber luminess.

The other day in the smoking compartment of a Pullman a discussion was raised as to timber and lumber, and a gentleman asked me if there were not a few white cask trees left in the country. Upon my reply that there was perhaps more timber left in the country than that of which the general public was aware, another one of the party mentioned that he had been of the opinion that there were larger returns in lumber than from any other business. I think that the lumbermen themselves are responsible for the views held by the public, for the reasons that they have continually insisted upon giving as a defense to all charges brought against the industry the scarcity and high price of stumpage, there not being the big profits in the business that are generally supposed. They have had to enlarge upon this feature of the game in order to satisfy their creditors, especially their bankers.

This association has carpostly striven to eliminate as far as possible the losses in marketing lumber by providing what I consider a fair sales code and set of grading rules. Without fear of contradiction I believe our sales code stands today as the clearest, the best and the fairest term ever presented to the lumber industry.

One of the great drawbacks to intelligently marketing hardwood lumber is the grade issue. This fact has been recognized by lumbermen and great effort has been made the past few years to accomplish a single grading standard as a basis upon which to transact our sales. Although repeated and carnest efforts have been made along this line, we do not appear to be any nearer a conclusion than we were five very ago.

This is a question in which the consumer is as vitally interested as is the producer. A man making a finished product from lumber today is competing with substitutes, and every penny expended in purchasing a higher grade of raw material then required for his specific purpose handicaps him to that extent in meeting the competition which he must face.

When this organization framed its grading rules they were not formulated in an arbitrary manner, but with a view to giving the consumer the grade required, as far as knowledge of the requirements were possible to attain at that time. All changes made in the rules since have had this principle in view. Do you for one moment believe that an intelligent body of business men, such as compose this organization, would undertake to legislate a grade of lumber that was not adapted to the purpose of the consumer? One of the greatest difficulties that we have had to combat on this grade question is the lack of knowledge of the rules on the part of the buyer. He has been prejudiced against the rules by the erroneous impression freely advertised that this organization had as its object the continual lowering of grades. I do not know but what we have to some extent assisted in this impression by our frequent statement that the lowering of grades was essential on account of the growing scarcity of timber.

While it is true that the timber does not today produce as high grades as in the past. I believe that with improved methods of manufacture we can still meet the demands of the consumer for a satisfactory grade, provided he will lend his assistance toward utilizing the lowest grade that is profitable for him to use in the production of his finished commodity.

An illustration as to the extent to which our rules have been misinterpreted. I have frequently found people condemning our rules when in discussing the matter I find that they had scarcely read them, having taken someone else's statement as to what the rules provide.

On the question of specific grading, which seems to have been the principal point at issue. I have found some who made the statement that our rules provide for the grading of lumber on the best side, regardless of what the reverse side might be, and have made illustrations to me that a

W. H. WELLER, CINCINNATI, O. SECRE. R. M. CARRIER, SARDIS, MISS. MEMBER. CLINTON CRANE, CINCINNATI, O. MEMBER. TARY

EXECUTIVE BOARD.

board could be 1s and 2s on one face and No. 4 common on the other, and under our rules still be graded as 1s and 2s. I defy anyone to point out any paragraph or phrase in our entire set of inspection rules that indicates we grade lumber from one side only.

In the cut-up grades our rules provide for a given per cent of either clear face or sound cuttings, and you will find further that the rule provides the grade of these particular cuttings, describing in clear face cuttings not only the face but the back.

Read the rule on sound cuttings and tell me if you can inspect a sound cutting under that ruling without taking into consideration both sides of the cutting. In our grade of select poplar, which is strictly a one-face grade, you will find the rules provide as to the character of back the board must carry. It is true that we get our cuttings from the best face. If you want a breefsteak you do not send to a drug store to get it; we go where it is "at" and do not tell the inspector that the board must contain a given per cent of clear face cuttings, but you must go where it "aint" to get it. Any rule that provides for a clear face cutting with a further provision that it must be taken from the poor side of the board means but one thing and one thing only. Not what it says, a clear face cutting, but a clear cuttings. Why deceive or haggle; if clear cuttings are Decessary say clear cuttings are

Is the consumer today demanding or getting the grades of lumber his specifications call for? Is it not a fact of general knowledge to every man in the manufacturing ond today that a number of consumers grade specifications are higher than they are actually accepting. It is a common occurrence to hear a man in the trade say that "So-and-so specifies a grade that I would not think of turnishing at the price I am selling if I had to furnish the grade in accordance with his specifications. I know what his grade demands are, and I can afford to meet them at the price I am getting."

On the other hand, however, there are other consumers who have taken the time to familiarize themselves with the grading rules, and are demanding absolutely what they buy in the way of grades. What is the result? The consumer who is accepting a grade of lumber below that which he specifies is barring himself from competition of all producers except those who are familiar with the exact grade he will accept.

Again when selling consumers who are termed "technical on inspection," the seller is continually meeting competition of lower quotations by his competitors, who thinks he, like other consumers, is specifying a grade higher than his requirements, or that he is willing to accept. Is this chaotic condition in the inspection of lumber good for either the manufacturer or consumer? Is it not a fact that the only one who benefits is the one who is unscrupulous in his business methods. Are we to legislate for the legitimate or the illegitimate factors of the trade? Every effort to revise a grading rule has been met with the statement, "Do not change rules; if necessary increase the price," it being argued that uniform in spection could not be brought about unless the rules stood for a sufficient length of time until every one became familiar with them and that particular standard was recognized.

Gentlemen, it is my firm belief that no set of grading rules for lumber will ever become standard until they are right, and for my part I am willing to change them every thirty days if necessary to make them right. Are we willing to admit that there is not sufficient intelligence in our business to properly interpret and apply a set of grading rules that are clearly written? I admit that in all the present inspection rules before the public there is at some point or other within those rules room for misinterpretation or misapplication, but I am not willing to admit that there is not sufficient intelligence to prepare rules that will eliminate these difficulties.

I might say in this connection that I am of the opinion that all grades of lumber aside from clear lumber should be graded as to the per cent of clear, clear face or sound cuttings that the board will produce, thereby reducing the matter of inspection to a mathematical calculation instead of the judgment of inspectors, as to the seriousness of any designated defect.

In making this statement I have in mind the general use of lumber and not the specific uses. There will always be a time when a special grade will have to be made to meet special requirements, but whenever that requirement reaches a magnitude sufficient to justify a standard grade, such grade has been and will always be provided.

It occurs to me that it is high time those interested in the lumber business, and in this I include the consumer, wholesaler and manufacturer, should eliminate the strife among themselves and present a solid front to our real and active competitors, the producers of substitutes for lumber. I venture the opinion that most of the difficulties and ills of the business could be remedied by a strong organization of manufacturers, and equally strong organization of wholesalers and even, if you please, a strong organization of consumers. Such organized bodies could thrash out and solve those problems easily and quickly.

I cannot close without one word on the matter of association, or cooperation. I believe that every man should affiliate and assist organizations which are striving with the problems that confront their industry. You will find in this, as well as in all other industries, a difference in men. There are those who give enthusiastically, not only of their time and money but the best that is in them in brain and power. Then there are those whose sympathy and direct interest lie in the association movement and who give liberally of their money but do not participate actively in the work by giving their thought to the problems that are to be solved. These men stand next to those who give both time and financial aid, and it is between these two classes that organizations are made effective.

There is another class which recognizes the benefits of association work and who are willing to derive the benefits therefrom without giving of their moral or financial support. They are what we might call "umbrella men." No argument can be used upon them except to appeal to their manhood and spirit of fairness.

There are others who do not affiliate themselves with associations justifying their position on the ground that associations are not properly manged or do not accomplish what they are attempting. At one time I felt the same way, and I remember distinctly resigning the membership of my company from this organization. At the request of the late Mr. Fisher I explained my reasons for withdrawing, and he, looking at me, said: "Young man, no one gets what he wants without fighting for it. If this organization is not being run to suit you, get in and try to fight it around your way."

I have been in the fighting ever since. I cannot say more to that class of men than Mr. Fisher said to me.

There are still others who do not take the time to consider whether it is to their interest to become affiliated with the erganization or not. Just stop to think how efficient any organization would be representing one hundred per cent of the output of any commodity. Its strength is only weakened as it falls short of this maximum percentage. We might well take a lesson from the Chinese, who recognize the wastefulness of the lack of coöperation, who have guilds or associations in every line of trade. If there are fifty tea dealers in a Chinese city the tea guild will consist of fifty members. It is one of the traditions of their trade that all should belong to the appropriate guild.

Our organization is not a social but a strictly business movement. During the two years which I have served as president there has never been a time that there were not sufficient funds in the treasury to carry out

W. H. DAWKINS, ASHLAND, KY. MEMBER TRANK F. FEE. DERMOTT, ARK., MEMBER W. B. BURKE, CHARLESTON, MISS., MEM-EXECUTIVE BOARD EXECUTIVE BOARD BER EXECUTIVE BOARD

any idea or work desired by your executive heard, and you will note by the treasurer's report that we do not owe a dollar; all current bills have been paid to date, and there is in our treasury the largest cash balance ever reported at an annual meeting. Do you think the members of this organization would give such financial aid to this work if they were not firmly convinced of its benefits to the industry?

Two years ago when elected to this office I told you that I would give you the best that was in me. It is with great satisfaction that I can conscientiously say today, "I have fulfilled that promise."

I want to thank you for the hearty coöperation I have received as your executive officer, and I bespeak for my successor the same ardent and loyal support which you have given me.

Report of Treasurer C. M. Crawford was read by Secretary Weller, which gave the following statement of the association's finances:

Cash	in bank	January	31, 19	13			\$ 2,323.98
Petty	cash in	office					1.93
Cash	receipts	of year	ending	January	16th,	1914	28,214.63

Total cash	\$30,540.54 24,841.98
Balance	\$ 5,698.56
Cash in bank\$ 5,698.49	
Cash in office	

\$ 5,698.56

The secretary then read the report of the official auditor, which showed that the association's records are in first-class shape.

Secretary Weller read his interesting and instructive report, one of the strongest points brought out being the fact that the association has increased thirty-eight per cent in membership during the past year. This report follows:

Report of the Secretary

BUREAU OF GRADES

During the greater part of the past year three inspectors have been employed by the association. They have been so located as to enable us to give prompt attention to complaints.

An accurate comparative statement with previous years as to the quantity of lumber reinspected cannot well be made, as since March 1, when the new rate of \$10 per inspection was adopted, it has been our custom to inspect, as far as possible, rejects only. This method of reinspection, which was adopted after a careful canvass of the consuming trade and consultation with our members, has been most satisfactory to both.

Members applying for reinspection work are requested to cooperate with us and have their dustomers hold intact only the rejects if there is no complaint as to measurement, or unless for some special reason they desire the entire shipment surveyed.

We have done no loading this year at point of shipment except for export or shipment to the Pacific coast.

MILL INSTRUCTION

The members of this organization are realizing more and more that the keynote to the successful marketing of lumber is correct and uniform grading, and that an efficient inspection department is of first importance.

Since May 1st Chief Inspector White has visited the plants of many of our members and given grading tests to their inspectors with a view

to ascertaining whether or not they were making the best application of Hardwood Manufacturers' grading rules. After the tests were completed written reports were made for the management showing the results of these tests. Some of our members have been so well pleased with this work that they have called for the chief inspector's services a second or third time, feeling that it served their best interests to keep their inspection department at the top notch of efficiency.

This feature of our work is decreasing to a great extent the claims that are so annoying to the shipper and buyer of lumber.

The man who grades lumber stands in the position of handling his firm's money, and it should be his employer's first thought to learn whether he is efficient and knows the correct application of Hardwood Manufacturers' Association's grading rules. An educated inspection force will reduce the number of complaints. The concern that ships uniform grades and builds a reputation for giving its customer what he requires will have acquired an asset of inestimable value.

This service is free and we urge all members to adopt the plan of periodically checking up their inspection department. Non-members who are interested in this work are invited to write the secretary and arrange for the chief inspector's services for a day or two so that he can show them just how our rules apply.

, GRADING RULE BOOKS

The grading rule books which were issued April 10, 1913, have been distributed in large numbers to manufacturers and consumers of hardwoods. Our members have found it a good practice to order them in quantities and distribute them to their customers. Not only have the books been distributed in this country, but in Canada and foreign countries as well.

At the request of the Railroad Storekeepers' Association, by which these rules have been adopted, the Master Car Builders' Association and the Master Mechanics' Association, we issued 2,500 copies of grading rules covering railroad construction timbers in which were illustrated the various defects described in these rules, and sent them to the Railroad Storekeepers' Association for distribution. These rules are a reprint of those published in our book of standard rules of April 10.

MARKET CONDITION REPORT

Owing to the condition of the lumber market, this report has been issued only once in book form, the date of issue being May 20. Monthly supplements to this report have been distributed. These supplements show the number of sales made under or above the prices of the various woods published in the report of May 20 and the variations from list at which these sales were made. These reports we believe have reflected accurately the prices that prevailed at time of publication.

The membership is urged to cooperate with the secretary in the preparation of market reports, and a prompt response by every member to requests for information will improve this service.

Reports are furnished to members only.

COMMERCIAL REPORTS

Our members find that the interchange of ledger experience, as given in these reports, is a safe basis upon which to found their judgment of credits.

It is not our purpose to give the capital rating or financial standing of a prospective customer, but to indicate whether he is prompt pay, settles by note, meets notes promptly, settles accounts according to agreement, accepts inspection rules of this association, makes unjust claims upon grades, amount of credit to which he is probably entitled, whether he is considered a good risk, etc., etc.

E. B. NORMAN, LOUISVILLE, KY, MEMBER W. M. RITTER, COLUMBUS, O. MEMBER EXECUTIVE BOARD

EXECUTIVE BOARD

The method of preparing these reports is as follows: Upon receipt of an inquiry we immediately send out a printed form to our entire membership requesting them to give their experience with the concerns listed, based upon actual business dealings in the past. The answers to these questions are reproduced exactly as they are received by us and sent in strict confidence to all members who participate, without divulging the names of the concerns giving the information. Any member is privileged to ask for these reports.

This feature of our work is not in competition with any recognized credit organization. The information we give is usually of a character that cannot be furnished by anyone else. This service is for members only and there is no extra charge for it.

SALES CODE

The use of our sales code is becoming more prevalent and its value recognized, and we urge all our members who are not using it in making quotations to give it their earnest consideration.

Many concerns have printed, on their letterheads immediately under the salutation, others use a rubber stamp which is furnished by the secretary upon request, the following:

All quotations and contracts are made subject to the sales code and spection rules of the Hardwood Manufacturers' Association of the miled States now in effect, copy of which will be furnished on applica-

This form was adopted by the executive board, after much thought and investigation, as being comprehensive and protecting alike buyer and seller, and a clear understanding of the terms of sale before the order is closed eliminates much trouble and possible loss in case of dispute, as the terms of sale and method of adjustment are explicitly set forth in this code.

EXECUTIVE BOARD MEETINGS

Your executive board during the past year has held four meetings, the dates being May 17, August 26, November 28 and January 20.

PUBLICITY DEPARTMENT

This department has issued during the past year eight bulletins in which suggestions of interest and importance to the industry have been placed before the members. Along this line might be mentioned an article in the July Bulletin in which attention was called to the fact that both sides of the board must be considered in making a grade of lumber under Hardwood Manufacturers' Association rules. This was done for the reason that there existed, particularly in the consuming market, a feeling that all of our grades were made strictly from the better face of the board.

Also call attention to an article in the September issue on the advantages of shipping uniform grades. This was touched upon in this report under the head of Mill Instruction.

We believe that the "Stock Wanted " and "Stock For Sale" departments of the bulletin has led to considerable new business for some of our members

PINANCE

The financial condition of the association, as set forth in the treasurer's statement, which has been checked and approved by the official auditor appointed by President DeLaney, is most gratifying. The association starts the new year with all debts paid up to date of closing the books and with a very substantial balance in the bank.

Despite the fact that there has been some complaint of slow collections in the past few months, the association has suffered very little in this respect. Its members have realized that the organization is worth more to them during periods of depression than at any other time and have not withheld their financial support.

MEMBERSHIP

The membership of the association has increased very materially in the past year, the gain being about thirty-eight per cent, the largest increase for any year in its history. This is evidenced by the financial condition of the organization, which is much better than at any time in the

Among our members are the largest producers of hardwoods and owners of timber in the Southern hardwood district.

FIGHT AGAINST SUBSTITUTES

We have taken an active part in the fight against substitutes which has been waged by the lumber associations in the last few months. Especially have we tried to have the interests of lumbermen protected in the steel car legislation by asking our members to take up the fight through their congressmen and senators, from whom numerous letters have been received promising their support. We think that the result has been that most of the legislators from the hardwood producing district are now thoroughly alive to the interest of their constituents and that when bills are presented proposing the elimination of wood from car construction good reasons will have to be shown why it should be climinated before such will receive their support.

We do not favor the wooden car, but we do believe that the combined steel and wood car has merits that are worthy of consideration, and all we ask is that before any laws are enacted both sides shall be given a fair and impartial hearing and that the case be decided on its merits, and that lumber shall not be legislated out because of the public hysteria which has been created by lurid accounts of wrecks which have been published without proper consideration of the real cause.

Your secretary has devoted more than half of his time since coming with you May 1 to traveling among the mills in the interest of the association. Personal work is the most effective means of building up and maintaining the organization.

It is gratifying to see the interest that the concerns not yet affiliated with us take in our work, and the general feeling is that the Hardwood Manufacturers' Association of the United States is the one great organization which has made it possible for the producer of hardwood lumber to market his product at a reasonable profit and for the consumer to feel sure that when he buys lumber he will receive what he has ordered.

This has been accomplished largely through our grading rules, which have been framed with the interest of the manufacturer and consumer in mind; the inspection department, which stands for a square deal on both grades and measurement, and its publicity department, through which it endeavors to keep its members in touch with market conditions and all things of vital interest to the industry.

I desire to thank the members of the association for their assistance in helping to promote the welfare of the organization and their cooperation with the officers in the work that has shown such good results the past year.

R. H. Vansant then moved that the president appoint committees on officers' reports and on resolutions. The motion being carried, President DeLaney appointed as the committee on officers' reports E. A. Lang, chairman; G. E. Luehrmann, S. B. Anderson and Claude Moore. On the resolutions committee he appointed Thomas W. Fry, chairman; A. P. Steele and Ralph May.

The afternoon session was opened by a motion from R. H. Vansant, suggesting that the president appoint the nominating commit-

W. B. TOWNSEND, TOWNSEND, TENN., MEM-E. O. ROBINSON, CANCINNATI, O. MEMBER, S. LIEBERMAN, NASHVILLE, TENN., MEM RER EXECUTIVE BOARD BER EXECUTIVE BOARD EXECUTIVE BOARD

tee. This motion being duly carried, the president announced that he would read the names of this committee later.

President DeLaney introduced John A. Fox, representing the Mississippi River Levee Association. Mr. Fox announced that he had requested the opportunity of addressing the meeting on behalf of the levee project and then told in a very concise and convincing way of the purposes and importance of that proposition. He stated that he had asked for the opportunity because an adequate levee system is essential to the lumber interests operating in the 29,000 square miles embraced in the Mississippi delta. He stated that thirty one states send their overflow water down through the Mississippi and that the damage resulting from the insufficient levees is tremendous.

He stated that his association is trying to bring the national congress to a full realization of the importance of work of this sort and stated that it is vastly different from any flood problem that confronts any nation or locality on the globe. According to the statement of Mr. Fox, \$70,000,000 have already been secured through local taxes and the project needs a further \$60,000,000 to put it through. He stated, however, that in his opinion the government will concede its duty in this direction and take hold of the rest of the work to be accomplished. The Mississippi River Levee Association was formed for the purpose of pushing this project and is now urging the passage of the Ransdell-Humphreys bill at Washington, which will provide for an appropriation of \$12,000,000 a year for five years, to be used for purposes as outlined by government engineers. He suggested that interested lumbermen lend their assistance to securing the passage of this bill.

R. H. Vansant then presented a resolution bearing on this project. as follows.

Whereas, The hardwood lumber industry of the United States is seriously injured by reason of the floods in the lower Mississippi valley; and

WHEREAS, These floods are caused by the drainage waters of thirty-one states of the nation, or more than forty-one per cent of its total area, thus rendering the problem distinctly a national one; and

WHEREAS, Plans and estimates have already been submitted by the corps of engineers of the United States Army and by the Mississippi River Commission for controlling these floods by a system of levees and bank revetments, at a cost not to exceed \$60,000,000; and

WHEREAS, A measure known as the Ransdell-Humphreys bill, now before Congress, provides for an appropriation of such moneys as are needed to carry these plans into effect; therefore, be it

RESOLVED, By the Hardwood Manufacturers' Association of the United States, in session at Memphis, Tenn., this 21st day of January, 1914, that we heartily endorse said measure as affording the most direct, feasible and practical means of solving the flood problem in the lower Mississippi river and respectfully recommend it to the members of Congress as worthy of their support; be it further

RESOLVED. That a copy of this resolution be sent to the president and vice-president of the United States, to each member of the cabinet and to each member of the Senate and House of Representatives in Congress.

President DeLanev announced the nominating committee as Simon Lieberman, Nashville, chairman; E. L. Davidson, Parkersburg, W. Va.: Leon Isaacson, Coal Grove, O.

James Boyd of New Orleans then read the following interesting paper on logging methods and the Southern Loggers' Association:

Logging

On account of the good work of the Southern Logging Association, organized by me in 1910, which has come to its attention, the board of governors of the Hardwood Manufacturers' Association of the United States invited me to talk to you today about logging.

There is no department of lumbering, with the possible exception of the sales department, where there is an opportunity for so much loss as in the logging department.

Prof. R. C. Bryant, professor of lumbering, Yale Forest School, Yale University, in a recent letter says:

University, in a recent letter says:

I have traveled over the greater part of the South during the last seven or cicht years, and have visited a good many operations. One thing that strongly impressed me in the logging work has been the lack of standardization of logging methods, even where operators were work in the control of the strong standard that the control of the strong standard stand

The object of the Southern Logging Association is to bring about a low cost of logging, which can be done only by standardization, while standardization can only be accomplished by a discussion of methods at frequent intervals by men who are actively engaged in logging operations. The Southern Logging Association affords the medium of exchange of ideas and experiences in an orderly manner. Its greatest accomplishment has been to stimulate each superintendent to compete with himself, so that he is constantly lowering his costs. Instead of approaching his work with an attitude to get through with it anyway so it is done, he makes a study of it, having in mind solely how it can be done in the quickest time and at the lowest cost.

At our meetings we take up every phase of logging. We usually begin with the tree, ending with the mill pond. In the last two years lower stumps are common practice, resulting in a saving of considerable lumber in the best log in the tree. One of our members says his employer says that since he attended our meetings he saves twenty per cent of what he used to waste. Laying out spurs and building railroads are subjects that are always fruitful for discussion. It has developed that steel gangs handle four, five and six rails a day up and down to a man. The superintendents who were getting only four rails found out that they were deficient, so when they got home they speeded up their gangs. Some men use hewn ties, others poles. A variation in the prices paid for ties resulted in savings to those who had been paying too much.

At one of our meetings inquiry was made as to the cost of unloading coal burned in locomotives. It was found that it varied from \$3.20 to \$15 a car. The \$15 man was using his section crew to do the work. One man said he had been paying \$10 a car, which he thought too much, so he looked around, finding a man who would do it for \$5. He then found some men who would unload it for eight cents a ton. Another man said

R. H. VANSANT, ASHLAND, KY., MEMBER E. M. VESTAL, KNOXVILLE, TENN., MEM- F. R. GADD, CHICAGO, H.L., MEMBER BER EXECUTIVE BOARD EXECUTIVE BOARD EXECUTIVE BOARD

it cost him only fifty cents a car. He built a trestle, insisted in getting coal in hopper cars and dumped the coal,

Incidents of saving are many. There is on file in the secretary's office if letter from a lumber company acknowledging a saving of \$6,000 because it sent its superintendent to one of the meetings. He had a problem as to bow to get to certain timber and to get it out. He outlined his plan. It was discussed, new views were proposed, and an agreement resulted in a plan that effected the saving.

The program at our annual meeting in Sentember included addresses on possibilities of a second cut of Southern pine; close utilization of timber; organizing new legging camps; camp boarding houses, or how to feed men; detailed accounting; bonus system or task work; log cutting; feed; civil engineering problems; fuel and care of engines and welfare work in logging; camps. All of these addresses were discussed. In addition there were discussions of problems in logging hardwoods, cypress and yellow pine; problems of skidders and loaders; care of blocks and wire cable; laying track

Most of these subjects have a direct bearing on hardwood logging. Another subject of greatest importance to hardwood lumbermen is the discovery of some cheap method of keeping bugs out of logs at certain seasons of the year

Economy in your logging operations will result if you will join the Southern Logging Association. We will hold meetings especially for hardwood Interests at convenient places when nothing but subjects pertaining to hardwoods will be taken up and discussed. The need for such meetings will be apparent when I tell you that I sent out letters to five mills each in Arkansas, Louisiana, Mississippi, Alabama, Tennessee, Kentucky and West Virginia asking for information regarding costs, so that I could submit it to you, but it has not come in such shape as to be available for comparison.

One concern writes:

We regret that we haven't our records in such shape that we can give you the information requested.

Another writes:

Our cost runs around \$5 to \$5.50 per M log scale. We log oak, ash, gum, elm and a small amount of cypress. Logs average fourteen feet long, two logs to the tree. Use skidder and teams. Lands, bottom lands Arkansas.

Another writes:

Our logging is done with teams and a steam loader, the average cost leng cutting \$1, hauling \$3, tram road construction \$1, tram road peration fifty cents; total average, \$5.50. Handled, 1913, 4,000,000 et. Louislana. being operation

Another writes:

Our logging to mills costs us from \$3 to \$5 per M log measure. Our mbered lands are all located in middle Tennessee, oak, poplar and timbered chestnut.

Another writes:

We pay from \$4 to \$5 for most of the logging that we have done. We operate in several localities, Virginia, Tennessee and North Carolina. Most of our logging is of a very rough character, being well up in the mountains. It is all done in the old fashioned way, with cattle, horses, mules and men.

Another letter reads:

Another letter reads:

The way in which our stumpage is used makes it a little difficult to comply with your request for logging statistics, but I will give you all of the information that seems pertinent.

You understand, of course, that we are using our large timber through the mills and the cut-over lands are then being worked for the tie timber left on them. In addition to this we supply the timber for an ash handle factory, a bickory and onk spoke factory and a heading mill, so you can see that our entire timber operations contemplate the practical removas of all the stumpage from our lands. They are taged 180 feet, part of them having come down the river and the balance having been brought in by our logging train.

The cost of delivering the logs to the mill was 87.67 as compared with 1.51 a year ago. The total amount manufactured into lumber was 28, 22.442 feet. We use some home-made log loaders, built on the style the old Decker-Spudg-arrd loaders that were in vogue some time to. These we find very satisfactory for our type of logging. We work ago. These we a

cattle and maies.
This section of the country is made up largely of what is known as ridges and swanps. The ridges are simply little elevations which stay dry while the swamps are wet. We try to do our longing during the months of October, November and December, so as not to be compelled to work in the water during the winter or wet season. Of course, there are some special log bills to come out all of the time, and we maintain places we try to work the ridges, and so far have succeeded in doing this very nicely, so as to keep the mills supplied with plenty of timber right along.

this very meet, so as to be a right along.

As soon as our logs are cut (no matter whether it be in summer or in whiter) we crossote the ends with a weak solution of a home-made mixture that resembles lorac, but that is considerably cheaper and serves the

ture that resembles lorac, but that is considerably cheaper and serves the purpose just as well.

Our logging operations are located about thirty miles south of the milit and we maintain two engines to handle the loading. These are small saddle-tank engines, and the road work is done by a standard locemotive of the mogul type. This road locemotive makes two trips each day and brings the trains into the plant, where they are taken in the river. The floaters are sent down stream to our No. 1 mill and the sinkers are picked up by an overhead trolley and taken to the No. 2 mill.

Another operator, who is getting out mostly continuously and taken to the No. 2 mill.

Another operator, who is getting out mostly cottonwood and gum with about fifteen per cent of oak and miscellaneous hardwoods, reports:

about fitteen per cent of oak and missecitaneous hardwoods, reports:

During the period January 1, 1913, to Cotober 1, 1913, we logged 14,114.123 feet at the following costs: Timber cutting, 57 cents; logging
to track, \$2.17; loading ears with loader, 31 cents; railroading to mill,
89 cents; total, \$3.94. Tracks are usually laid half a mile apart, so
that hauling is from a pickup to half a mile. The cost of railroading
is based on tariff rate of our incorporated road. Logs average three to
tree, and about four to the thousand feet. Arkansas bottom lands; skid with teams.

You have just listened to reports from six logging operations. There is not much basis for comparison, but some deductions can be drawn from the data before you. The lowest cost is in Tennessee, where one concern reports cost of from \$3 to \$5 a thousand and another \$4. Neither company gives the amount of logs put in by it. It is too bad that the details were not furnished to us, for then we could make a close analysis, determine which was getting its logs in the cheaper and show where the other concern could save money. That is what the Southern Logging Association does for those who attend its meetings.

Two reports come from Arkansas. One gives costs at \$3.94, the other \$5 to \$5.50 a thousand. The latter does not give details. A Louisiana operator reports \$5.50, giving details. These three operations are under similar conditions as to country. If the Arkansas \$5.50 concern had given us details of its operations, we would have a basis for a profitable discussion. As it is, we can compare the Arkansas \$3.94 proposition with the Louisiana \$5.50 proposition. In Louisiana cutting was \$1 a thousand, in Arkansas 57 cents a thousand, a difference of 43 cents in favor of Arkansas. We do not know why there should be this difference, but there is an opportunity for the Louisiana man to scale down his cutting cost. He put in 4,000,000 feet last year. If he can save 43 cents a thousand, he would save \$1,720. This possibility would have appealed to him when the subject of log cutting was brought up at a meeting of the Southern Logging Association, causing him to find out there and then why the other man was able to save so much.

The Louisiana concern reports cost of hauling logs to track \$3 a thousand. The same Arkansas concern reports \$2.17. Both use teams. This is a difference of 83 cents a thousand in favor of Arkansas on hauling, or a possible saving of \$3,320 on the annual output of the Louisiana concern.

The Louisiana concern reports no cost of loading on cars while the Arkansas concern reports 31 cents. If the cost of loading is included in

GEO E W LUEHRMANN, ST LOUIS, MO. W E DELAMEN, CINCINNATE, O. CHAIR THOS, W FRY, ST. LOUIS, MO., MEMBER MEMBER EXECUTIVE BOARD MAN EXECUTIVE GRADING COMMISSION EXECUTIVE GRADING COMMISSION

the 83 haaling cost of the Louisiana company, and 31 cents loading is added to the 82.17 hauling cost of the Arkansas company, the hauling and leading will be 82.48 as against 83. There is room here for an in vestigation, which would undoubtedly show where savings could be made On this basis the Louisiana concern could save \$2,080. We have figured a possible saving of \$1,720 on log cutting, \$3,320 on hauling, or \$2,080 for hauling and loading, a total of \$5,040 or \$3,800,

The tram road operation of the Louisiana concern cost 50 cents, as against 89 cents tariff for hauling logs of the Arkansas company's incorporated road. There is no data as to the length of haul. The Louisiana operation has \$1 a thousand for tram read construction, which does not appear in the report of the Arkansas operation, although its spurs are placed half a mile apart. It may be that the incorporated road of the Arkansas operation pays for the construction of spurs and the operation of spurs and main line.

Another Arkansas operation reports log scale :

Another Arianaes operation reports og scare.

Catting 11.682,799 feet, 89,987 per M.; team hauling, 9.776,514 feet, 82,126; stram skilder, 1,906,285 feet, 82,247; stram loading, 11,317,412 feet, 82,247; railroad expense skilds to mill, 1,222,699 feet, 85,312; total cost 87,297 log scale. Rouch, quite hilly in some sections and bottom lands. Hardwood logging done along with plue. Hardwood logs average 160 feet of lumber

As compared with the \$3.94 operation it pays 41.7 cents more for cutting; 4.4 cents less for team hauling; 31.2 cents more for steam loading; \$3.512 as against 89 cents for transportation, or as against \$1.50 for the Louisiana operation. One of these Arkansas operations put in 14,114,123 feet of logs and the other put in 9,776,514 feet with teams; cut, 11,682,799 feet, loaded 11,317,413 feet; and hauled over the railroad 13,223,698 feet. These two concerns could get closer together on several items.

Here is a statement from a Mississippi company giving comparison of three years' work:

1911.	1912.	1913.
Scaling\$0.05	80.04	\$0.04
Cutting	.80	.79
Hauling to track	2.44	2.38
Building railroad	.75	.75
Labor loading cars	.23	.20
Repairs to loaders	.08	.09
Oils for loaders	.01	.01
Fuel for loaders	.04	.03
Labor transportation to mill	.30	.26
Repairs to locomotives and cars	.29	.22
Oils for locomotives and cars	.01	.02
Fuel for locomotives	,23	.23
Main line maintenance	.14	.14
Labor unloading at mill	.08	.10
Repairs to locomotive crane	.04	.02
Fuel for locomotive crane	.01	.02
Insurance and taxes	.01	.03
Totals\$5.64	\$5.50	\$5.33
Amount 1911-27,315,742 feet.	η	40100
1912-24.709.478 feet.		
1913—29.615.817 feet.		
, *******		

Note how the cost has steadily decreased, a saving of \$5,034.55 in 1913. The company reporting has been a member of the Southern Logging Association since its organization.

Timber runs 42 per cent oak, 53 per cent gum and remainder ash, elm and mixed hardwoods. Timber averages 375 feet to log and about 21/2 logs to the tree. Logs average eighty per cent 14 feet and 16 feet lengths. All logging is done in bottom lands, which is perfectly flat, and at certain seasons of the year very wet. One ground skidder and two loaders are nsed.

From the reports to which you have listened, that go into detail, the following table is made:
Cutting, 57c, 83c, 98.7c.
Hauling, 82.126, 82.17, \$2.88, \$3.
Loading, 31c, 33c, 64.2c.

Railroad expense, including spurs and main line to mill 89c, \$1.50,

A number of replies were also received from concerns that do their logging by centract and from others who buy logs delivered on railroads. None of them, however, gave any figures,

You will be surprised at the way your men will take hold of these logging meetings, how well they will talk and criticise, with what vigor they will attack their work when they get home, and how your costs will decrease. Many times has the statement been made, "There are no two logging jobs alike, so that the costs are the same.

It is true, but if the man who is in charge of the logging as a result of attending legging meetings becomes so impressed with the idea of keeping down his costs that he works with no other object in view, he is constantly saving you money, so that the \$10 a year the association costs you is an investment bringing in dividends every day in excess of the original amount invested.

The constitution of the Southern Logging Association provides:

The constitution of the southern Logging association provines:

The membership of this association shall consist of mill owners and finite owners represented by their logging superintendents and general managers and contractors, whose daily output is 10,000 feet or more and who are in actual operation for some lumber manufacturer.

Your membership is invited. It will return the investment many times every day.

Effort, to be productive, must be organized and directed. Few persons work to advantage alone. Most of us lack initiative. This makes organization

In the discussion which followed, many interesting points were brought out, which demonstrated the necessity for more uniform methods of logging in hardwood operations and that such uniformity could be at least partially secured by a full membership in the logging association

R. M. Carrier of Sardis said that hardwood men were not adequately represented at the recent meeting of the association at New Orleans. He suggested that hardwood loggers should either organize a separate association or that a hardwood branch of the present association should be formed. He said further that he had been assured that the association would maintain such a department if adequate membership were assured. He said that he preferred the maintenance of a hardwood department in the present logging organization.

In response to the criticism of C. Crane, to the effect that different conditions would prevent benefits to hardwood operators except by district, Mr. Carrier responded that he made no suggestion that the association as an association endorse the project, but that the individual members take out membership in the present logging association.

E. B. Norman of Holly Ridge, La., said that he had attended the recent meeting at New Orleans, being a member of that association, and that he and his logging superintendent derived great benefits. He said that the average logging operation has been far from scientific, but that there is unquestionably an evolution in modern logging which is now taking place, the principal change being from the former methods of logging by animals to the adoption of logging by machinery wherever it is at all possible. He stated that in his opin-

1. HARRISON, CAPE GIRARDEAL MO. MEMBUR EXECUTIVE GRADING

AUBLIEF KRAFTZER A VICE PRESIDENT THE KRAUTZER COMPANY CHICAGO

ion much benefit would result from sending logging superintendents to the meetings. T. M. McCormick of Sardis, Miss., an experienced logger, said that he had learned more in the one meeting he had attended than in ten years of practical experience. Mr. McCormick said that most of the loggers attending that session had come equipped with facts and figures. He cited as one instance of the beneficial suggestions that were presented a statement from one of the camp managers in attendance whose figures showed that the cost of boarding his men was but one half of that of any of the others attending. When asked to prove these figures, he said that he employed part of the time of certain employes in his camp to plant and taise vegetables and as a result he bought none of this class of food.

John H. Friant of the Himmelberger-Harrison Lumber Company expressed his opinion of the possible results to be derived from such an organization. He said that it costs him about \$4,00 to cut and deliver his logs to the tram road. E. W. Tschudy of Memphis Tenn., expressed himself as believing most heartily in the logging association and its purposes. Mr. McGraw said that his chief objection to this association was that he was a logging contractor and that he did not want the millmen to have too much information.

Claude Moore then stated that he is cutting out all day labor and that he is paying not over \$2.00 for pick-up of one half mile and less.

T. E. Day said that he hires all logging by the thousand and that he does his cutting by the day. He stated emphatically that the man that cuts by the thousand ruins untold quantities of timber. This statement was greeted heartily by the listeners. Mr. McCormick then said that there is a great difference in the height of stumps left in the woods. He said that this is one of the important questions that comes up before the logging association and that since its organization the height of stumps has been very materially reduced. He expressed himself as believing that hardwood operators should all join the organization.

James Boyd, secretary of the logging association, then said that it was not necessary for hardwood men to meet with pine loggers at New Orleans, but that meetings could be held at any convenient place.

R. M. Carrier moved that a committee be appointed to report on the discussion at the next session. The motion was carried.

President DeLaney announced meetings of the executive grading commission and of the executive board. He appointed the following committee to report on the logging discussion: T. B. McCormick, chairman; J. H. Friant and E. W. Tschudy.

Thursday afternoon's session was opened by the committee on of ficers' reports, which recommended the adoption of those reports. The motion of the chairman of the committee was seconded and duly carried.

J. E. Rhodes of Chicago, secretary manager of the National Lam Fer Manufacturers' Association, told of the purposes and accomplishments of that organization and of the various broad questions which it is attempting to solve. His outline of the broad field of national association work was listened to with interest. He then described the Forest Products Exposition, which will be held in April and May at Chicago and New York, and told of its purposes and the vastly important position it bears regarding the market for products of the American forests. He urged that the members of the Hardwood Manufacturers' Association lend their interest and assistance to this project and urged them to participate in the expositions.

J. H. Friant, chairman of the committee on logging, then reported, recommending that the association commend the work of the logging association, and further recommending that individuals become members of that organization. The report was accepted.

R. H. Vansant, chairman of the executive grading commission, then reported the changes recommended by that body, as follows:

Report of Executive Grading Commission

On elm, maple and sycamore the grade is to be made the same as on gum and cottonwood in the number 2 and 3 common grades. This will standardize the cuttings in all woods except those commonly used for manufacture into clear cuttings.

WAGON STOCK GRADING AND INSPECTION RULES

Wagon Box Boards

Basswood, Bay Poplar (Tupelo), Cottonwood, Gum, Poplar and Magnolia, Widthigs Wide, 13 to 17 inches Narrow, 9 to 12 inches

LENGTHS 12, 14 and 16 feet, but 15% may be 11, 13 and 15 feet.

THICKNESS Must be 1 inch thick when shipping.

Defects. Must be free from defects, excepting that no objection will be made to bright sap or sound discolored sap; also one sound knot, not to exceed 134 inches in diameter or its equivalent, showing on one face only Eleven feet lengths to be free from splits; 12, 13 and 16 feet lengths will admit of a 12-inch split in one end or its equivalent in both ends; 14 and 15 feet lengths will admit of splits not to exceed 6 inches in one end or its equivalent in both ends.

Note Sixteen feet lengths may have other defects so that the board will make one side 11 feet long and one end piece 3 feet 6 inches long

Nort. Five per cent in feet of a shipment that can be reduced in measurement by cutting the end or edge or both to a size ordered must be accepted and measured as box boards, separate tally to be kept of such boards, showing reduction in measurement

Norn Inspectors are cautioned that "Woolly" cottonwood and lumber so warped that it cannot be used for box boards must be excluded from

The changes were adopted as read.

Mr. Vansant stated that he had been chairman of that body for twelve years and that he desired to retire and expressed the wish that President DeLaney be appointed in his place.

Thomas W. Fry, chairman of the resolutions committee, read the following resolutions, and supplemented them later with a resolution thanking the trade press for assistance given the lumber association:

WHEREAS, The members of the Hardwood Manufacturers' Association of the larged States who are a fortunate as to be at this meeting, have convoid themselves for the utmost; and

Williams. The activity and Lospitality of the Lumbermen's Club of Memphis contributed in a large degree to this enjoyment; and

Wirracy, The commute of the Lumbermen's Club of Momphis has been indefictigable in its efforts to make the occasion a successful and ennyable one; therefore, be it

RESOLAED. That this association hereby express its gratitude to the Lumbermen's Clare of Memohas for all it has done in their behalf

Resoratio, That a vote of thanks be tendered to the retiring officers and executive board for their untiring efforts toward the furtherance of the objects of the association; their work well shows in the great interest shown at this meeting, in its increased membership and in its substantial bank bulance.

Wheneas, Representative K. D. McKellar has introduced in the House of Representatives Bill IR 9771, which provides and makes if compulsory for carriers to Issue through bills of Inding 1 and

WHEREAS, Representative K. D. McKellar has introduced in the House of Representatives Bd9 H R 9753, which amends the Harter act to the extent of making owner manager, agent or master liable for loss or damage arrising from faults or errors in navigation or management of vessels; and

Whiralys, Our members are vitally interested in seeing these bills enacted; therefore, be it

RESOLVED. That this association in joint convention go on record as approxing these bills, and that a letter be written the speaker of the House of Representatives asking for their prompt consideration.

The resolutions were adopted as a whole,

Albe t Kraetzer of Chicago gave an interesting talk on scientific lumber drying:

Scientific Seasoning of Lumber

I'm going to talk on a subject that is as old as the "Hills" (meaning Sam Hill and "Yim" Hill). Let me first draw your attention to the deterioration or waste that occurs during the period that elapses between the time good lumber is taken from the chains and poor lumber is taken down from the pile. To the average sawmill man this is not so apparent, because he is used to it, while an observant outsider may see it instinctively. The sawmill man will try to save ten cents per thousand in the cutting of his lumber; I am concerned in reducing his loss in degrade during the drying period. I'm concerned in cutting down this loss from \$1.50 to 50 cents. In 1912 over thirty billion feet of lumber was produced. Suppose only 50 cents per thousand of degrade on only ten billion feet of this had been avoided; five million dollars would have been saved. Let's try to save some of this for ourselves.

Not all improvements originate from the Inside, but when they originate from the outside they are mostly due to the desire of the originator to make some money for himself thereby. Occasionally an improvement is suggested by an outsider, on the spur of the moment, without expectation of an emolument.

A case in point happened to me. For a number of years—a period I'd like to forget—I was engaged more or less unsuccessfully in trying to amass a competence by the manufacture of interior trim. One day an acquaintance, a music teacher, came in to have a special music rack made. He had a sketch that looked like a cubist picture of the bray of a doukey, and as we were very busy finishing up a sixteen-flat building, I tried my best to turn him away, but he stuck. Finally I offered to get out the necessary strips for him, and this he met by the flatfooted assertion that he could not drive a nail straight. So the easiest way to get rid of him was to make his contraption.

While this was being done he wandered around to where a couple of workmen were assembling the first of sixteen rather elaborate sideboards. He watched them for a minute or two and then called me over. "Say," said he, "why don't these fellows put that thing together this way?" I looked at him just as most of you would look at a stranger that presumed to criticize your methods; but I had sense enough to give him a second thought, and, sure enough, what he had seen was true, and we saved over a dollar aplece on fifteen sideboards. Of course I appreciated his suggestion, and to show my appreciation I charged him \$1.25 for his rack instead of \$1.00, which I think was letting him off very reasonably.

My plant was located in a distant corner of Chicago, and our product for years consisted of pine finish. The cork pine of those days was easy to work: was straight and easily dried; so when our trade gradually required more and more hardwoods, our troubles increased. What struck me most was the crookedness of hardwood as compared with pine, and I often wondered how a sawmill could possibly produce so poor an article—how it could possibly lead its saws around the curves.

Then a chance presented itself to visit a southern sawmill, and when I saw the beautiful lumber that came from the chains, I said to myself, "Aha! I've discovered something. This isn't the kind of lumber I've been getting. I'll just want till they been to saw the crooked stuff." But they

kept on sawing the same beautifully manufactured boards. Then I interviewed the sawyer. I complimented him on the excellence of his product and asked him, "When are you going to saw some crooked stuff? I am curlous to see how you do it." He was a big burly guy with large competent hands, and when he stopped his carriage and looked at me in that tone of voice I was instantly reminded that I had pressing business elsewhere. So I wandered out to the yard. There I saw the kind of lumber I had been getting, coming down from the pile. Just then the yard foreman hove in sight and I tackled him. Said I, "Mr. Smith, where do you keep your straight lumber?" I just knew from his looks that he wondered who had left the gate open. "I mean the kind that is coming off the chains now." The same expression that had been on the sawver's face came over his, but as he was a rather small man I stood my ground. "This is some of it," he said, and added belligerently, "what's the matter with it?" Dubiously I walked away from him. Was I seeing things? Or was he so obtuse that he could not see the enormous deterioration the lumber had suffered in its progress from the chains to the dry state? Honestly, he hadn't noticed it. Nobody connected with the institution had particularly noticed it. It seemed to be taken for granted, at least, that this big loss could not be avoided, or rather they did not seem to know there was a loss. They didn't even want to waste time enough to talk about it; on the contrary, they talked me into buying a carload or two, and so I dismissed the subject

Some time later I had occasion to make some bent oak pieces for covering the caps of a lot of iron columns in a certain building. Nearly all of us have a "man Friday" around the piace, and my man Friday got this job. The stuff was '1," x 4" oak, bent to a 7" radius. (The pieces were tipped from a green plank procured from a neighboring shipyard.) He made a small steam box and steamed these pieces—in loose steam, of course and then bent them around forms. This was all comparatively new to me and I watched the operation like a hawk.

Overnight these bent pieces had dried and had set in the bent shape. (Please remember the word set, for I shall refer to it again.) The pieces were dry, they were set in their new shapes—very obstinately so—were of a rich color, and the working qualities were so much better than on ordinary oak that I marveled. Then a number of similar cases came to mind, and in every one the factor of set entered. The bent plow handle, the bent top of the walking stick, the bent shafts of the buggy, the bent portions of certain spindly chairs, the scythe handle, and a host of others,

They all exhibited this factor of set, which in the case of the plow handle resisted even constant exposure to the weather. In every case the bent part held its shape—held it tenaciously.

Then I had an inspiration (I'm taken that way quite often, and they are not induced, cither.) Why wouldn't the same stuff handled in the same way but bent straight have the same characteristics? "Sure," said Friday. And then began a most interesting series of experiments. I soon found that steaming in loose steam did not reach the center of inch lumber quickly enough; so why not try steam under pressure. Well, I'll not weary you with a recital of trials and tribulations. Suffice it to say that after several months I was doing stunts that were surprising, and in every case the lumber was "set"—straight and holding its shape.

So now on to Washington for a patent on the greatest discovery of the age! I had the world by the neck! Mind you, this was ten years ago—and the world's neck is still free.

Well, in Washington they were very polite, very nice and, oh! so sorry: and they shoved a patent on the process of steaming lumber under pressure, under my nose, that was dated 1859. 1859! Thirty years before I was born! Have you ever had a favorite mother-in-law die on you? I felt as though all three of mine had died!

And again a host of instances came to my notice. George D. Emery of Boston had been steaming ordinary mahogany under pressure twenty-five years before and selling it to the Pullman company as emery wood. Today a prominent manufacturer of fancy woods is delivering dry mahogany in six hours from the saw.

Only a few weeks ago a practical veneer manufacturer and scientist, a Russian, told the National Veneer & Panel Manufacturers' Association about this process as applied to veneer logs, and stated that it had been in use for over thirty years in Finland. So-and-so had used the process in such and such a year, and so-and-so at such and such a time, etc., ad anascain.

Well, after all, I could continue to use it in my business, and I worked up quite a local fame for it. Anyway, I could handle any kind of lumber, no matter how green, and materially straighten out the crooked. In short, kiln-drying troubles no longer existed for me. My product stood the gaff under all sorts of conditions; heat or cold, wet or dry, it was all the same to it.

A famous five and ten cent store concern has my material in over a hundred stores: from New York to Kansas City, and from Duluth to Prankfort, and I'll defy anyone to find a trace of shrinkage. Kiln-dried oak in seventy-two hours? Kiln-dried birch in thirty-six hours! Kiln-dried popular in twenty-four hours! Easy as falling off a log.

One day a recollection of the sawmill came, and with it the thought, "If this is so huge a success on lumber that is at least partially air-dried and has already suffered its deterioration, why not treat lumber fresh from the saw before this degrade has occurred, and air-dry it?"

Why not

I experimented in a small way on what green material I could get in

Chicago, and the results were so good that I bought a mixed car of southern hardwoods (from the same null by the way) and had it shipped green from the saw. Most of this I treated and piled in the yard for air-drying, and on the rest I experimented with the kiln, The results attained on green lumber in the kiln were not very satisfactory; but, say, the product resulting from steaming, air-drying and subsequent kiln drying was so surprising that even I was astonished. To this day my former foreman dilates on that the oak of 1904. He never could be con vinced that the treatment was responsible, but insists it was a special growth of trees that had furnished in

Crooked lumber? Not on your life! A number of other desirable features also developed of which more apon-

And then I got clusty and advertised. In June 1904 the American Lumberman gave me a flattering writeup, a copy of which is still preserved in the archives. And people came from near and far and marveled some even came from Memphis I talked till I was blue in the face, and the more I talked the more they marveled. As I look back upon it now I strongly suspect they marveled at me. As they walked away they seemed to shake their heads, and I was reminded of the farmer who saw the giraffe for the first time and, even after he had seen it move and eat, turned away and said, "Oh, shucks: they ain't no sich animile; but that danged slick talker of a keeper 'most made me believe they wuz.

And nothing came of it for years.

I continued to use the process with better and better results. Today I would not use a foot of good lumber for cabinet work that at some point in its drying period had not been properly subjected to steam under pressure.

I'm almost "saturated" with steam under pressure. I know that lumber treated in this manner is a joy, just as all of you know that the boiled, baked or friend potato is palatable and a joy, while the raw potato-well, presumably, in case of a pinch one might live on it.

And the theory of it all? It is always more satisfying to achieve results first and then try to adapt a theory. It is still more satisfying to be able to say: "To the divil with all theories; here's the result." here are some of the results of steaming lumber under pressure ;

If properly handled after proper steaming, lumber will dry straight and flat, to less weight, in less than half the time required for ordinary wood; shrinkage will be less than half; borers will not damage it; casehardening is prevented; hollowhorning is prevented; checks and endsplits minimized; stain is prevented; the color is diffused and livened; working qualities greatly improved: the lumber will hold its shape after being milled; its strength will be greater.

Now I'd like to take a crack at the expression, "common sense," "horse sense." In some horses horse sense means a disposition to kick one in the slats, and often common sense means piling lumber so closely that air cannot possibly circulate. In this connection I quote from a recent pamphlet of mine on

THE ORDINARY PILE

The present and universal method of piling lumber effectually retards the circulation of air. All the layers are horizontal sidewise, and most lumber is piled with small spaces between the boards. In addition, the piles are covered with a water and practically air-proof roof; consequently, the circulation upwards is entirely prevented. Moreover, the piles are placed closely together, which still further retards efficulation ber of stickers, which also retards circulation; so that lumber as now piled is hampered in every way for drying and slowly dries in spite of all obstructions.

all obstructions.

The best evidence of stagnant air is furnished by the temperature between the piles of the yard. Always the air is considerably cooler between the piles, and always it is quiet.

With the present practice of pitching the pile lengthwise, the sawdust and dirt gradually move down to the stickers and lodge there, forming a damp mass in the angle of the sticker and the board. This starts are still a driving rain more or less water is forced into the pile, and days elapse before the center of the pile is dry again.

The tendency to crook is more pronounced because of the strains resulting from unequal drying.

And now listen to this:

AXIOMS ON AIR

A pile of lumber is dry only when the center of the pile is dry. This is as true of the pile in the kiln as it is of the pile in the yard. The sides, ends, top and bottom of the standard pile dry more rapidly

The standard pile dry more raphry has the center.

The remedy is: Pile the lumber in such a manner that the center its as much circulation as the outside.

Edge piling is the most positive; the side pitch pile is next in effec-

tiveness.

The medium for firying lumber is air, and this air, to be effective, must be in motion over the surface of the lumber.

Stagnant air takes up moisture very slowly, while air that is in motion takes up moisture rapidly.

Washing hung outdoors even on a cold day, with a breeze blowing, dries very quickly, while washing hung in a closed room dries very slowly even though the room be hot.

A pile of lumber through which the air can circulate freely will dry more rapidly and evenly than a pile in which the circulation is obstructed. Lumber, especially sap, will mildew in stagnant air just as old linen will mildew in a damo corner.

Lumber, especially sap, will mildew in stagmant air just as our men will mildew in a damp corner.

Therefore, the main requisite for drying lumber is freely circulating all—air feely circulating through the entire pile.

Air cannot be confined in an inclined flue that is open at both ends. Air will constantly move in an inclined flue that is open at both ends. Let's apply these axioms to:

THE SIDEWISE PITCHED PILE THAT IS LEVEL LENGTHWISE Alt is constantly moving through the pile. No matter what the conditions surrounding the pile, the air moves at all times. It may not move very rapidly, but it moves: consequently drying is uninterrupted, and the center of the pile will dry practically as fast as the outside. Is it not an everyday occurrence in "taking down" a pile to find after out the tenth course that "it is still too heavy?" This will not be the

is it not an everyour occurrence in "taking down" a pile to find after out the benth comes that "it is still too heavy?" This will not be the se in the side pitch pre. Top dry, all dry. The pile is dry again as soon as the rain is over, every ther forms roof of its own, and every fier sheds the water as fast as a roof will, be grootes made by the band saw, forming numerous small gutters, also dp. Clean water, provided it can drain off at once, does not harm hole; answer.

lumber arroway.

Cross sticks are always as dry as the lumber itself.

There will be no acc unulation of sawdust in the angles of the quid the lumber will be clean when it is taken down, as all the re will be no acc imputation of sawdist in the angles of the stickers, be limber will be clean when it is taken down, as all the dust and ave gradually rolled off, kers do not form an obstruction to circulation of air, as they form less of the flues and the air moves parallel with them.

Investment in stokers will be loss on account of speedier drying, a stickers are required in a tier, as the lumber dries more evenly, ore straighten.

The Less stickers

Less stackers are required in a tier, as the numer times more evenly, evelone straighter. Covering boards are desirable to protect only the boards in the top urse from the sun, and should not form a tight roof.

A pitch of one foot in six feet is sufficient, and this angle is no drawing the time of the funder.

Another misquotation that always gets my goat is, "I'm from Missouri and you've got to show me." I'd change this to read, "I'm from the tall grass and you can't show me," And that always reminds me of a certain fat man, for this is my ideal pile in the ideal yard. The ideal yard is the rail storage with the lumber on wheels.

PHE IDEAL PILL

Trucks lengthwise of the pile. This method furnishes a perfect foundation, for the bottom of the pile will be as straight as the supporting

rails.

Six wedge-shaped cross pieces with a pitch of ten inches in six feet (two inches on low end and (welve inches on high end), laid crosswise

in the trucks.

Tour-inet spaces between the loards. This greatly induces ventilation. Bry stickers, I inch square. These provide good ventilating space between the layers and permit the parts of the noards that are covered by the sticker to dry as rapidly as the rest of the boards. Covering boards should under no circumstances form a tight roof. Put one covering board over each board of the top course for protection from the sun. In not let these covering boards neet edge to edge.

The widely spaced load will dry faster than the closely-piled, and for that reason no more storage space is required the member, 2500 feet of green oak will weigh about 15,000 pounds, and it requires lots of "beef" to move H.

In conclusion, I am reminded of the man that was addressing a Sundaychool class and in the course of his talk hesitated for a moment and said, "Really I don't know what else to say." A little girl's voice piped up with, "Say 'Amen' and let's go home."

Then followed what was probably the most valuable feature of the whole meeting, namely, a general discussion on business conditions, from which talk it could plainly be seen that members of the association view the future with considerable satisfaction. It was pretty clearly brought out that there will be no accumulation of stock during the present year and that there is no chance of anything but strengthening in lumber values. In fact, it was the consensus of opinion that the year 1914 will be one of the best ever experienced by the lumber trade.

R. L. Murdock of Vaiden, Miss., said that before the discussion on business was started he desired to express his appreciation of this, the first meeting of the manufacturers' association which he had ever attended. Mr. Murdock is an old-time lumberman of Mississippi and his remarks were characteristic of the typical southern colonel. He said humorously that he was surprised to find that the hospitality extended to the visiting lumbermen was extended in the main by Yankees, but added that the hospitality nevertheless was of the southern type. Mr. Murdock arose to speak as a stranger to most of those present, but when he sat down all felt that they were old friends

. Simon Lieberman of Nashville opened the business discussion with a review of the history of the association. He said that he was one of the first in the Middle South to join, and then reviewed its gradual development from its inception up to its present important character.

Mr. Lieberman said that his concern carries from 2,000,000 to 3,000,000 feet of hardwood lumber and that during 1913 business was excellent up to November. He said that it slowed down from then to the end of the year, but since January 1 he has noted a new life in inquiries and orders and predicts that 1914 will be the best year for the lumber business in the past twenty-five years. Mr. Lieberman said, however, that he would not make that statement without at least attempting to prove it. He said that he had talked with the senator from his district, who expressed himself as believing that this will be a boom year. He gave as his reason that money is loosening up and that there will be plenty of it for investment and that the administrative currency measure will result in bringing out all this available cash instead of concentrating it at a few points. He said that it will bring out gold from Washington to the regional

reserve banks which has lain dormant at Washington for years, and the curse, the larger rong way towards clearing up the financial situation. Mr. Lieberman said that his concern is holding its lumber and that it is not at all disposed to get rid of it without making a fair profit, as he considers that hunber is a better investment than almost anything he knows of.

Hugh McLean of Buffalo said that he finds stocks the lightest in twenty five years in the East and Canada in the consuming centers and that his observation is that mill stocks are also light. He said that his concern is holding its lumber, except for immediate shipment, as it does not believe in making large sales for future shipment at prevailing prices.

A. E. Norman of Holly Ridge, La., endorsed the previous statements, and added that he would not take orders at prevailing prices. He also said that producers' stocks are below normal. He expressed himself as optimistic as to the money situation and recommended holding stocks pending advance in prices, which is bound to come soon.

M. S. Hewitt of Indiana, representing the contingent of consumers who were in attendance, spoke in behalf of the maintenance of more uniform price levels. He said that prices go from one extreme to the other and that the low level of values is usually the result of the desire on the part of millmen to make a dollar too quickly. He said further that as soon as conditions are in fair shape the millman over-produces, which brings conditions eventually back to where they were before. Mr. Hewitt said that it is difficult for the purchasers of lumber to tell when to buy, because of this unsteady condition of the market, and he said further that the consensus of opinion at a convention of retailers which he had just attended was that manufacturers should operate steadily, regardless of conditions, which would result in a far more uniform price level. Mr. Hewitt also said that retail stocks are really low at this time because retailers have not purchased in the face of the downward trend of lumber values and in fact they did not know whether they should continue to hold off or should get into the market.

Lee Wilson of Memphis expressed himself in accord with Mr. Hewitt's ideas and said that manufacturers should produce more steadily.

G. E. Luehrmann of St. Louis said that hardwood stocks are low because shortage of funds has held up operations. He said that good times are ahead. Mr. Luehrmann suggested that the president request all those in attendance who have more than 1,000,000 feet of dry lumber on sticks to stand. Only about twenty-five per cent of those present stood. A. E. Norman said that some of those in attendance sometimes have from 20,000,000 to 30,000,000 feet of dry lumber on hand and that the demonstration gave a pretty good idea of the present stock conditions. President DeLaney then said that his concern has had as much as 30,000,000 feet of lumber on sticks and that it now has about 5,000,000.

S. B. Anderson of Memphis stated that in his opinion the whole question hinges on the law of supply and demand. He said that logs are not plentiful and stocks are not high, and expressed himself as believing that improvement in the demand for lumber is inevitable. He said that prices will be entirely fair if manufacturers confine themselves to reasonable output. He said that the difficulty arises from the fact that when business is good the output is increased. Mr. Anderson stated that business men should be optimistic but reasonably cautious; that they should note general conditions and keep fairly close to the ground.

Upon the suggestion of Mr. Anderson, President DeLaney asked all those who were running less than full time to stand. About thirty of all those in attendance got to their feet. The question was raised, however, as to the significance of such a showing, inasmuch as river mills are naturally shut down more or less on account of the inability to get out logs while there is ice in the rivers.

Mr. Anderson then said that the question of running full time hinges entirely on the log supply. He said that it is a mistake not to run full time if a full supply of logs is on hand. He raised the question as to whether the members of the association were logging moderately or to excess. The question was decided by request on

the part of the president that those curtailing the input of logs stand. About twenty five per cent of those in attendance arose, which indicated that there is some little curtailment of log input.

F. R. Gadd of Chicago said that stocks at both the mill and consumers' yards are light. He said that business was good in 1913 up to November and that it then went flat. Mr. Gadd stated that the gum and oak meetings, held before the convention sessions, brought out the fact that stocks in those woods are low. Mr. Gadd said that his concern recently turned down an order for 1,000,000 feet of gum for future delivery, as he had faith in the future market for that wood.

J. E. Rhodes, speaking along the same lines, said that 1913 marks an epoch in the history of the country. He reviewed the accomplishments of the administration in Washington. He said that business and financial conditions in Chicago and New York show a much better condition than a short time ago, and that 1914, looking ahead, looks much better than does 1913 looking backward. He said that the passage of the currency and tariff bills and the recent expressions of President Wilson regarding the trust question removed from business the menace of these political drawbacks. Mr. Rhodes said that deposits in Chicago banks during the three weeks in January were bigger than any three weeks in 1913, and that the quantity of loans was smaller.

Speaking of stocks, Mr. Rhodes said that they are low all over the country and that confidence in the year 1914 on the part of the lumber business is shown by shipments.

R. H. Vansant expressed himself as impressed with the talk of Mr. Hewitt regarding uniformity of cut and prices and expressed himself as believing that if conditions should improve rapidly prices ought not to advance rapidly, but should be governed by cost of manufacture and sales. He expressed himself as believing that prices should hold uniformly in justice to the consumer. He said that he had not changed prices in two years.

C. Crane, Cincinnati, said that during 1913 the average value received for his lumber was \$1.60 more than it ever sold for before. He said that his concern manufactured 40,000,000 feet during 1913 and sold 47,000,000 feet. He further said that if his stocks do not bring in 1914 an average of \$2.00 in excess of prices received during 1913 they will stay in the yards. Mr. Crane said that the only danger that he sees in the future is that stocks will be too light to take care of the general demand. Speaking of collections, he said that they are good and that during the last three months they have been as good as he ever experienced. According to the speaker, the collections of his concern are \$140,000 a month and during the past three months about ninety per cent of this has been in cash. He said that the tariff and currency questions are buried to the satisfaction of everybody and thinks that the next three or four years will develop the best business in the history of the country.

S. Lieberman of Nashville got a little out of the line of discussion and talked of the benefits to be derived from association work, citing specific cases where his concern had actually benefited.

Mr. Lieberman was then called upon by President DeLaney for the report of the nominating committee.

Mr. Lieberman said that the choices of the committee were the result of feeling out the popular sentiment of the members. He then aptly introduced the officers recommended. The selection and recommendations of the committee were as follows:

PRESIDENT: John H. Himmelberger, Cape Girardeau, Mo. First Vice-President: B. B. Burns, Huntington, W. Va. Second Vice-President, Ralph May, Cincinnati, O. Treascere; C. M. Crawford, Coal Grove, O.

EXECUTIVE BOARD

W. E. DeLaney, Kentucky Lumber Company, Cincinnati, O. J. H. Himmelberger, Himmelberger-Harrison Lumber Company, Cape Girardeau, Mo.

B. B. Burns, C. L. Ritter Lumber Company, Huntington, W. Va.

C. M. Crawford, Yellow Poplar Lumber Company, Coal Grove, O. W. B. Burke, Lamb-Fish Lumber Company, Charleston, Miss. R. M. Carrier, Carrier Lumber & Manufacturing Company, Sardis, Miss.

Clinton Crane, C. Crane & Co., Cincinnati, O.
W. H. Dawkins, W. H. Dawkins Lumber Company, Ashland, Ky.
Frank F. Fee, Fee, Control Hardwood, Lumber Company, Dermott. Ark

Frank F. Fee. Fee-Crayton Hardwood Lumber Company, Dermott, Ark. W. A. Gilchrist, Three States Lumber Company, Memphis, Tenn.

- E. A. Lang, Phepeke Leicht Lumio, Company, Chicago, El-
- E. B. Norman, Norman Lumber Conquiny Louisville, Ky
- W. M. Ritter, W. M. Ritter Lumber Company, Columbus, O.
- E. O. Robinson, Mowbray & Robins in Company, Cincinnati O.
- 8. Lieberman, Lieberman, Levenau & O Brien, Nashville, Tenn
- W. B. Townsend, Little River Lumber Company Townsend, Tenn. R. H. Vansant, Vansant, Kitchen & Co. Ashland, Ky.
- E. M. Vestal, Vestal Lumber & Manufacturing Company, Knoxville, Tenn. Ralph May, May Brothers, Cincinnati O.
- P. R. Gadd, Wisconsin Lumber Company, Chicago, III. sign P. W. Luchrymann et L. Luchty and Hardwood Lumber Company
- St. Leuis, Mo. J. F. McIntyre, J. F. McIntyre & Sons, Pine Bluff, Ark,

- W. E. DeLaney, Kentacky Lumber Company, Cincinnati, O., Chairman
- R. H. Vansant, Vansant, Kitchen & Co. Ashland, Ky.
- W. Fry, C. P. Luchrmann Hardwood Lumber Company, St. Thos Louis Mo.
- E. A. Lang, Paepcke Leicht Lumber Company, Chicago, 111.
- M. Crawford, Yellow Pordat Lamos r Company, Coal Grove, O.
- F 'A. Kirby, Cherry River Boom & Lumber Company, Philadelphia, Pa.
- W. B. Burke, Lamb-Fish Lumber Company, Charleston, Miss. W. H. Dawkins, W. H. Dawkins Lumber Company, Ashland, Ky.
- C. L. Harrison, Himmelberger-Harrison Lumber Company, Cape Girardean. Mo.
 - Frank F. Fee, Fee-Crayton Hardwood Lumber Company, Dermott, Ark.
 - J. W. Mayhew, W. M. Ritter Lumber Company, Columbus, O.
 - R. M. Carrier, Carrier Lumber & Manufacturing Company, Sardis, Miss. B. B. Burns, C. L. Ritter Lumber Company, Huntington, W. Va.
 - H. B. Nields, Little River Lumber Company, Townsend, Tenn.
- Mr. Himmelberger was elected by a unanimous rising vote on the part of the members and immediately following, the remainder of the ticket was elected as a whole in a similar manner.
- Mr. Isaacson and Mr. Lieberman were appointed by the chair as committee to escort the newly elected president to the chair. Mr. DeLanev then introduced President Himmelberger and in an eloquent speech of resignation told of the work he had tried to accomplish, with the assistance of the other officers, and said that he would endeavor to serve as faithfully while in the ranks. He commended the newly elected president very highly and bespoke for him the same support which Mr. DeLaney himself had had.

President Himmelberger spoke briefly, expressing his profound appreciation of the honor bestowed upon him. He expressed himself as willing and anxious to do everything possible to advance the best interests of the association during his administration.

B. B. Burns and Ralph May, first and second vice-presidents, respectively, followed with fitting speeches of acceptance and apprecia-

R. H. Vansant moved that the association confirm the selections of the nominating committee for directors from the various states. The motion was carried.

The meeting then adjourned.

ENTERTAINMENT

In addition to the various private functions in the various dining rooms of the city, and elsewhere, the visiting and local lumbermen were treated to an elaborate smoker and vaudeville entertainment in the banquet hall of the new Hotel Chisca. This immense room was completely filled. The entertainment committee of the association had made elaborate plans for the refreshment and entertainment of those attending. This function took place on the evening of Wednesday, and after it was over a general confab took place in the corridors and lobby of the hotel.

An Enjoyable Excursion

The Lamb-Fish Lumber Company operates at Charleston, Miss., the largest hardwood mill in the world. This concern has been a leader in adopting modern methods in logging and sawmilling and is justly proud of its operations. Believing that some of the visiting sawmill men would appreciate seeing the various features which it has inaugurated, including a very successful Kraetzer Preparator system, the company organized an excursion to its plant. About fifty-five visiting lumbermen boarded a special train at midnight on Thursday and arrived at Charleston in due time Friday morning. The day was spent in the general inspection of the company's operations at the mill and in the woods, and all returned on the same train Friday night, getting in Saturday morning. It is reported by those fortunate enough to have made the trip to Charleston that the weather and all other influences were most conducive to a thorough enjoyment of the excursion. The Lamb Fish mill is a busy place but this particular party was out for a holiday and had one. The inspection was not always of subjects connected directly with the lumber business. A full story will appear in the next issue.

The Badges

The handsome badges were presented by Joshua Oldham & Sons, the saw manufacturers, of New York City. Each was in the form of a circular saw carrying the insignia of the association suspended by a leather strap from the clasp, in which was inserted a card bearing the name of the wearer.

Manufacture of Wood Flour

Little wood flour is made in America, but inquiries are frequent concerning it, and this indicates that interest in the subject is general. Norway, Sweden, and Germany are the principal sources of supply, and it has been generally reported that the most approved material is spruce, and that sawdust is used, and that the machinery for reducing the sawdust to flour consists of a pair of old fashioned millstones, such as country mills employ in grinding corn meal. It appears from a report recently made on the subject by Consul Robert P. Skinner, Hamburg, Germany, that considerable misunderstanding has existed regarding the manufacture of this commodity. A summary of Mr. Skinner's report follows:

Norwegian flour contains more resin than German flour, the latter being produced from the waste cuttings by toy and wooden-shoe manufacturers. It has been stated that large quantities of sawdust of clean white northern ash are available in the United States for the manufacture of wood flour, and further details in regard to German mechanical processes have been asked for.

According to German experience hardwood is the best material for the production of high-grade flour, such as linoleum manufactures require, and this is turned out by machines, some of which are recommended as rendering equally effective service with roots, branches, boughs, sticks, tender shrubbery, slabs and wood waste of every kind. Reducing machinery of this character is used in preparing raw material for a good many chemical and other industries.

The ordinary process of producing wood flour in Germany consists of feeding the material into a revolving iron cross beater. The material should be not larger than one-half or three-fourths of the length of a finger, and it is beaten to the desired fineness as sawdust, in which is contained a large percentage of exceedingly fine meal. The capacity of the machine depends upon the fineness sought and the quality of the wood, brittle wood yielding a finer flour and a greater quantity per hour than any other. When it is desired to obtain a meal finer than sawdust a rasping mill is employed. These rasping mills have an interior construction similar to that of the iron cross beater, a rasping disk revolving against the inner walls of the apparatus, the metal plates of which present rasping surfaces. Light material fed into this machine to be ground cannot be ejected until it is perfectly ground, whereas in the machine first mentioned the iron cross beater merely revolves in the wood debris. When the output of flour sought is inconsiderable and time does not press, both an iron cross beater and the rasping apparatus can be utilized in the same machine.

The rasping mill turns out a product of a sieve fineness of No. 25 European. It contains a larger proportion of exceedingly fine meal than that produced by a beating cross. If still finer flour is desired than the rasping mill furnishes, the product of the rasping mill can be passed through a spiral-screw sifting machine. In these mechanical sifters the material passes through a hopper to spiral brushes, which transfer it continually to the face of the sieve, finally expelling the coarser quantities at the discharge hole. This coarse overflow can be returned to the rasping machine to be reworked, although usually the factories employ the coarse meal as it comes from the sieves.

Pieces of wood larger than one-half or three-fourths of a finger length should be crushed before being fed into the iron cross beater. If the material contains resin and a certain fineness is desired the resin must be removed by other machinery, which is fairly expensive.

From this it will be observed that while in Germany wood flour is not mechanically produced from sawdust, there is apparently no reason why northern ash sawdust could not be worked through a rasping mill, sifted and placed upon the market.

There is a brisk trade in wood flour in Germany, both for domestic use and for export. The most recent statistics include imports and exports of wood flour and excelsior under one head and are as follows: Imports, 1911, 5,192 metric tons, and 1912, 5,318.9 tons; exports, 1911, 7,213.5 tons, and 1912, 9,851.9 tons. Of the exports 703.8 tons in 1911 and 1,401.1 tons in 1912 went to France and 1,897.7 tons in 1911 and 2,295.2 tons in 1912 to Great Britain.

WALTER CRIM, SALEM, IND., SECOND VICE-PRESIDENT

Indiana Lumbermen's Annual

THE PROPERTY OF THE PROPERTY O

Present, past and future hardwood lumbermen of Indiana 20t together in their fifteenth annual home-coming, an unique function in lumber association meetings, at the Hotel Denison, Indianapolis, January 14. About two hundred members of the hardwood trade who have operated or are operating within the state, joined in an uplifting gathering at which good fellowship was predominantly evident.

The morning was spent in greetings and making new acquaint ances in the hotel lobby, the business session being called to order at two o'clock in the afternoon by President Van B. Perrine, Fort Wayne. President Perrine was not in good voice, owing to an accident he received some little time ago, and confined himself to a few short remarks, in which loyalty to the Indiana association was the most evident note.

President Perrine called to the attention of his hearers the fact that the Indiana association has contributed officers to the National associations on various occasions. He said: "We, as an association, should not take up business seriously but rather confine our efforts to good fellowship, home-coming and love for our fellow-lumbermen. I am going to pass over the subjects on which we have papers ably written, and am not going to attempt to give my views on the tariff and banking questions. You will have you own, and each one of you will admit, whatever they may be, that when you make money they are right—when you lose money they are wrong."

Secretary C. H. Kramer of Richmond then read an interesting report, as follows:

We have gathered here today in our fifteenth annual session. Our worthy president in his address one year ago stated to you that this association was allowing the other larger associations to do the work—that we now are an association of good fellowship rather than a business organization, which is quite true in the main—as no very important work has been brought out the past year and not a statistical association, I shall burden you with but a few remarks, so that the able addresses of this afternoon may be more appreciated by you.

You will remember trade reports early in the year, 1913, to the effect that stocks were short all over the entire field and that production had been greatly diminished, and everything in the hardwood line was saleable at very satisfactory prices, and some referred to same at highest prices ever known. The conditions then seemed wholly natural, the demand seemed to be on no unusual circumstances. This, however, did not seem to hold very long. The first few months brought in very good results, but activities began declining and from no apparent causes the short stocks both at the mills and in the hands of the consumers, did not create any flurry. The consumer seemed to be somewhat at sea

as to future conditions, his feelings were all but at case, as to placing his orders for any considerable amount of lumber for future requirements.

This conservative feeling carried through almost the remainder of the year, with, however, an occasional opening up, that here and there a good sized order was placed. Most of our members have fared well for the year as a whole, the first half they did exceedingly well, the latter half considerably less. From indications, as the opening of the new year progresses, the feeling seems very strong that business of most all kinds will be very materially increased. At present there is a fairly good demand for most hardwoods just the last few weeks a very noticeable activity in placing of orders, and in most cases single carload orders are for quick shipment. Just recently one of our wholesale customers in an inquiry for about twenty-five carloads of lumber, stated, "Can buy only for prompt shipment, so quote with this in view, as we are having orders cancelled with great regularity if shipments are delayed," which shows conclusively that not only the dealers are short in their supply, but the consumers are as well, and are buying only for immediate requirements, which to me, seems a very good barometer with not a complex meter to read.

Much has been said to discredit the use of lumber in many years, many thousands of dollars are being spent annually by manufacturers of substitutes, and it will require many thousands to set our wares aright and against some of the substitutes, but with all the substitutes, which may and are brought about, there seems to be still a good demand for all kinds of lumber. This should bring the manufacturer, however, to a most careful study as to obtaining at all times the most valuable product from his raw material and to study carefully channels wherein be can place the entire output to the very best advantage possible. Conservation, to a degree, can be practiced through the uses of lumber; when and where not to use it, consulting with your customer as to the most suitable material for his lines of work.

Another step that will greatly add to conservation and the life of our forests, as seems true, is the finding of a paint which is claimed to be fire proof.

As far as I have learned, no serious losses of any nature have been sustained by members of our association during the past year, other than that as caused through an act of Providence, being the flood of last spring. Many of you sustained losses directly immediately by having your lumber, logs, etc., drifted away, some never to be found or returned, and by the heavy earth deposit left on your lumber still on stick, making same undesirable and less valuable. Many sustained losses directly, but at an extended period, by having shipments on route to customers unable to get deliveries to points in flood district, and by having good accounts with customers in flood district, who suffered very heavy losses and were placed in such a condition as to be wholly unable to meet their obligations for possibly many, many months. You simply had to carry the burdens as no other recourse, all of you, I dare say may have stood it willingly and gladly.

I believe every manufacturer, every dealer, every consumer of lumber is having fewer claims every year, along the line of grades, as the rules are more stable, very few, if any, radical changes being made, and when

we reach the age in association work when uniform inspection rules aradopted, the manufacturers, dealers and consumers become familiar with the grading, we will find we will thereby comfuncts elains to the minimum

Most claims result from misanderstandings, errors. Show me a man who never makes an error and I will show you a man who never does anything and one until for your neigh or. Most of us profit by errors occasionally made.

Since the formation of our humber associations, great good has been accomplished, the short practices as carried on by the ansampulous and get-rich-quick element, whether manufacturer, dealer or consumer, has practically been channated. Thus we may add that by the formation of these associations the value, individually or collectively, is inestimable. Through organization, co-operation and education associations and education great things may and are befur accomplished.

Membership in our association has not grown very strong during the past year. Your bourd and membership committee have already considered for membership to this association the following:

Mass-Neimeyer Lamber Camany, Indiamapolis.
Bacon Lamber Company, Indiamapolis.
Godwin Inmber Company, Ireasant Lake.
Godwin Inmber Company, Persont Lake.
W. T. Thompson Veneer Company, Edinburg
R. W. Monger Company, Itkhari.
The Central Lomber Company, Akron.
J. M. Hubbel R. Son, Patricksburg.
Rohm Bres. & Co., Reckville.
Wm. Paulin, Jr., Middleton, O.
E. E. Londen, Salem.
E. E. Mitchell, Indiamapolis.
Jas. D. Cummings, Zelma.
Hammon & Scholier, Crawfordsville.

Along the membership line we have, I dare say, hundreds in our state who ought to identify themselves with this association. Many would join us if a personal friend should approach them, when a stranger would simply be east aside. I should like to see more personal solicitation.

Much has been said pro and con as to the advisability of the contemplated raising of freight rates by the railroad companies to an amount, as they state, of five per cent. I do not believe there is a man in our gathering here today but that desires and wants that the common carriers ought and should have just and fair compensation for their capital invested, but I do believe most of you, if not all, feel that lumber rates are now too high, and higher in proportion than hundreds of other commodities, and it would seem that lumber is discriminated against. An increase of five per cent means to you, on a fifty-cent rate, a loss of from five to ten dollars per car of lumber, owing to size of cars loaded.

Recently on a local shipment of 1,800 feet of 4/4" dry cottonwood box boards from Helena, Ark., to Louisville, Ky., freight was paid to the amount of \$28.50, a fitty-cent rate. Investigation found this to be the published rate, which is fourth class. Value of this lot of lumber at mill point was \$50.40. On this basis you will note it takes almost 1,000 feet of lumber to pay freight charges on 2,000 feet, or half the lumber to pay its own freight. No doubt many instances of this sort have been brought to your attention, not only of your own direct shipments, but those made by fellow lumbermen.

As opportunity affords, I believe, our association should give its moral support toward defense against any raising of rates of lumber; we should also assist financially, if need be; but to do so we would have to levy an assessment or through voluntary subscription, as from our regular dues we do not derive sufficient funds to permit our doing se.

W. W. Knight introduced Henry H. Hornbrooke, a prominent attorney of Indianapolis, who did much to clarify the federal income tax in the minds of the lumbermen present. After reviewing the events leading up to this legislation and speaking briefly as to its feasibility, he went into the various articles. He confined his remarks mainly to such phases of the laws concerning the average man. He grouped those coming under the law as "individuals, members of partnerships and corporations." This talk so clearly and sensibly set forth the features of the act that it is reproduced in another section of this issue of Hardwood Record as a separate article, under the heading "Clear Analysis of Income Tax."

Treasurer James Buckley, Brookville, then read the treasurer's report, which showed a balance on hand last report of \$495.23; receipts during the year, \$570; disbursements, \$640.85, leaving a balance on hand at the date of the meeting of \$424.38.

Fred S. Underhill of Philadelphia, who was a delegate for the National Wholesale Lumber Dealers' Association to the National Conservation Congress at Washington, spoke interestingly regarding what happened at that gathering. He was enthusiastic in his praise of the forestry committee, which, because of the great amount of work it had before it, met separately from the general congress.

 $W_{ij}(X_i, G_i, G_j)$ of conditions, committee, said that there was very little to report, as under present conditions all questions have to be put up to the Public Littles Commission of the state.

President Perrine then appointed as nominating committee: C. H. Barnaby, J. V. Stimson and W. A. Guthrie.

W. A. Guthrie reported for the forestry committee and reviewed the development of torestry measures in the state of Indiana. He said that the state board was created in 1901. was inexperienced and its methods of procedure were not the best. He went on to say that 200,000 acres of land were bought and improved and devoted mainly to planting experiments. Mr. Guthrie further said that throughout the state there is remarkable enthusiasm regarding tree planting, but very little real knowledge of the possibilities and proper methods to pursue. The object of the experiments is to determine proper species of trees to plant for future monetary returns. He went on to say that with the decreasing supply of hardwood stumpage in the state, lumbermen are now buying second and third growth and that he himself had paid more for timber from a third cutting than he had for a first cutting on the same tract. He said that the development of planting is handicapped seriously by fire and tax laws; that the habits of the inhabitants of the state are careless regarding the handling of fires, and that strict laws, rigidly enforced, in this connection would very materially help the situation

W. W. Knight, chairman of the committee on trade conditions, then read a short and interesting report, which said that the chief influences that have affected the business during the past year have been tariff and currency legislations. He prophesied that the tariff bill would not fulfill the promises made and that the benefits promised will not materialize, but that nevertheless the bill is passed and business men know where they are at regarding this influence. He went on to say that the American people are extravagant and must expect bad times occasionally. and that the present stringency in business should not be unduly alarming. He then said that trade reports for the last two weeks had been much more favorable than heretofore: that the New York automobile show has been very satisfactory and that buyers in Grand Rapids and Chicago furniture sales have already placed good orders. He looks, hence, for reasonable business during the year.

George S. Wood, manager of the Forest Products Exposition, spoke briefly regarding that proposition, emphasizing the fact that it is entirely non-factional as far as the different branches of the lumber business are concerned. He cited instances which prove the necessity of greater knowledge of wood and its probabilities not only among the laymen but among such professional men as architects who came into daily contact with its uses.

J. V. Stimson then presented a resolution endorsing the Forest Products Exposition and urging participation in it on the part of the individual members of the association.

The nominating committee then reported offering the following nominations for office during the ensuing year:

PRESIDENT—C. H. Kramer, Richmond,
FIRST VICE-PRESIDENT—Bedna Young, Evansville,
SECOND VICE-PRESIDENT—Walter Crim, Salem.
SECRETARY—Edward Richardson, Indianapolis.
TREASURER James Buckley, Brookville.

BOARD OF DIRECTORS—C. H. Barnaby, George Palmer, W. A. Guthrie, J. V. Stimson, Samuel Burkholder, Claude Maley, Frank Galbraith, Haines Egbert, W. W. Knight, E. A. Swain, George Waters, H. C. Jacoby, Frank Reynolds, Frank Sheppard, Van B. Perrine, John M. Woods, East Cambridge, Mass.

The newly elected president then took the chair and after acknowledging the honor bestowed upon him, asked if there was any new business to come before the meeting. Inasmuch as nothing new was offered, the meeting adjourned.

Nothing much can be said regarding the banquet which took place in the main dining room of the Denison in the evening, except that for entertainment features, attendance, talks, good

tellows), and enthusors of espalled, if it did not surpass, all presons to those. There were about two hundred in attendance, and they were inlightfully entertained by the spatisling speeched of July Al-Woods, Junes Barot, Prederick 8, Underfull and several others. In a first one of ple of tango artists illustrated

the intrinciers of that modern dance for the benefit of those attending.

The meeting and banquet easily maintained the reputation for hearty exchange of good fellowship in which particularly the Inchana association has long been the premier.

Clear Analysis of Income Tax

Editor's Note

The following article was read by Henry H. Hernbrooke before the meeting of the Indiana Hardwood Lumermen's Association at Indianapolis, January 11. It so cearry and sensibly sets forth the complicated features of that recent accomplishment of the Federal Congress, that it is herewith presented in the belief that at least a portion of the readers of Hardwood Riccord will be directly interested in such explanation.

I have been asked to say a few words to you on the subject of the federal income tax. In beginning I want to say that I am glad to see such a staid, sober and industrious body of Hoosiers. Evidently your habits here are all that could be asked and there would be no opportunity of embarrassment eming to your households such as occurred in the case of the gentiemas, whose wife, when asked what her husband's income was, replied

— "About 4 a. m."

We are living in the days and the land of democracy. One of the blessings in disguise which our Democratic friends have brought to us is the new income tax law. The income tax law passed in 1894 was held unconstitutional by the Supreme Court of the United States. Prior to that this country had had no income tax law since 1869 or 70. And so to most of us at least, the new law brings novel questions and we must all join the kindergarten for the purpose of learning our first lessons.

But when it comes to Uncle Sam we are all alike in this we don't waste any time cussing the law or trying to find ways of upsetting or evading the law. We simply get busy in the endeavor to find out what our duty is—and then go and do it—or rather go and pay it.

The law itself is rather intricate and the regulations issued by the treasury department have not as yet cleared up all the difficulties. Almost all the regulations that have been issued—and the discussion that has been had in the press—have related to one general phase of the law—i. e., the matter of withholding at the source. This was quite natural for the reason that the duty of withholding the tax at the source became an active duty on November 1, 1913, and some questions had to be settled at once, whereas the first schedules do not have to be filed until March 1, 1914, so that the matter of making up the schedules by the individual or company to be taxed was postponed for later consideration.

The time is now at hand when schedules are being mailed out to the individuals who are supposed to be liable to the tax—and to all corporations—so that it is a matter requiring almost immediate attention on the part of the average business man. What you men here are interested in primarily is the new law as it applies to you, and you are not much concerned in those portions of the law which apply to classes of individuals or corporations which are governed by the phases of the law which do not apply to you. Some days ago I gave a talk on the income tax law to a group of real estate rental agents. In that talk I discussed matters which would be wholly outside the matters in which you are interested. So let us try to confine myself to phases of the law which concern the average man in this audience.

The men in this audience are doing business in some one of three capacities—as individuals, as members of a partnership, or in the form of a corporation—and the law as it applies to such of these should be considered.

First—As to the partnerships. The law contemplates no income tax upon a partnership, and they will be required to make no return; but every member of a partnership having a total net income of \$3,000, or more, must make a return, and that re-

turn will include his share of the earnings of the partnership for the preceding year. It is especially provided that such share of the earnings does not mean the share which may be divided, but the share of what is earned by the firm. Further than this I do not believe anything more need be said on the law as it affects partnerships.

Second—As to corporations. Since 1909 there has been in force the federal law imposing a tax of one per cent upon the net earnings of corporations, which tax was imposed as a charge for the privilege of doing business as a corporation. From the total net income a deduction of \$5,000 was allowed. Under the income tax law the tax of one per cent is imposed upon the entire net income, without the \$5,000 deduction. With this exception, the law is very similar to the corporation tax law, and the schedules are very similar to those which were used under that law. The experience which you men doing business in corporate form have had in the preparation of your schedules under the old law, will probably be quite sufficient to enable you to make the new returns.

Two or three things, however, should be particularly pointed out, aside from the fact that no deduction of \$5,000 is allowed as under the old law. The first is the difference in the matter of allowance for interest paid. Under the old law a deduction from gross income was allowed of interest paid on an amount of indebtedness equal to the capital stock of the company, so that if a company was capitalized at \$25,000 and carried an indebtedness of \$50,000 on which it was paying interest, it was allowed to deduct only the interest paid on \$25,000 and thus to the extent of the interest paid on the remaining \$25,000 it had an income for tax purposes which it did not have in fact.

Under the new law the deduction to be made for interest is thus defined: "Total amount of interest accrued and paid within the year on an amount of bonded or other indebtedness not exceeding one-half of the sum of its interest bearing indebtedness and its paid up capital stock outstanding at the close of the year." This applied to a case similar to the above would mean this—the sum of the paid up capital and the interest bearing indebtedness is \$75,000. One-half of this is \$37,500, and it is the interest on this latter sum which would be allowed as a deduction.

The next point to be noted is this. Under the old law I believe it was necessary to make the return in every case for the calendar year. This was highly inconvenient for companies whose fiscal year was not coincident with the calendar year. Under the new law provision is made for a corporation making its return for its fiscal year instead of the calendar year, the return being made within sixty days after the close of the fiscal year. In order to take advantage of this provision proper application must be made to the internal revenue collector and formal notice of the fiscal year filed.

Again—some confusion exists in the minds of many people as to the duty of a corporation with reference to the dividends it pays. Inasmuch as an individual is not required to pay the normal tax of one per cent on dividends received from corporations, many have asked the question as to whether the corpor-

ation shall withhold from the seeds paid the in once tax of one per cent on behalf of the steadolders. Such as not the theory of the law, and the compact of hippar the full amount of the dividend without withholding anything therefrom.

One other thing may be of interest. The definition of gross means of a mercartile corporator from which the derictions allowable are to be made, is as to loss.

From the sum of the gross sales during the year plus the sum of the inventory at the end of the year, deduct the sum of the inventory at the beginning of the year plus the cost of goods and materials purchased during the year. To this difference add the income received from any other source (such as rentals, interest, etc.) and the result will constitute the gross income for the year.

Third—As to individuals. Who is to make a return under the law! Every citizen of the United States, whether residing at home or abroad, and every person residing in the United States though not a citizen thereof, having a net moone of \$3,000 or over for the taxable year. This settles two very important matters.

(a) If one's gross income is over \$3,000 but the deductions allowed by law brings the net to less than \$3,000 no return is necessary.

(b) If one's net income is over \$3,000, though less than \$4,000, a return must be made even though the party may be a married man residing with his tandy and thus entitled to a \$4,000 exemption.

Please hear in mind, however, that the return made for this year is for the ten months of 1913, beginning March 1, and the general provisos of the law are changed correspondingly, i. e., the exemption allowed is only five-sixths of that allowed for a full year. The duty of making a return applies to all having a net income of \$2,500 for those ten months.

What constitutes net income within the meaning of the law?
(a) In figuring gross income there should be excluded interest received from the bonds of the United States or any states, or any political subdivision thereof. Such income is absolutely excluded and need not be referred to in any way in your return.

You do not set it down and deduct it from your gross income.

It has no place whatever in your return.

I should stop here to say that this is not true in the case of a corporation. It must pay the one per cent tax on its entire net income no matter from what source derived.

(b) In figuring gross income there will be included:

1. All salaries, wages or compensation of any kind received.
2. Total amount derived from business, trade, commerce, sales or dealings in property.
3. Amount derived from rents and in terest.
4. Amount derived from any partnership to which you belong whether distributed or not.
5. Any other income, gains or profits not included in these.
6. In a separate item you will be required to set out all dividends received.

(e) In determining the net income there will be deducted:

1. The expenses actually paid in doing business but not including personal, living or family expenses. 2. All interest paid within the year on personal indebtedness. 3. All taxes paid within the year. 4. Losses actually sustained during the year in trade or arising through fire, etc., not compensated by insurance. 5. Bad debts actually ascertained to be worthless. 6. Reasonable depreciation.

After making these deductions you will have a tentative not income; but there yet remain other deductions for which appropriate columns are provided on the blanks in which you will set down your income for which the tax has been withheld at the source, and your income derived from dividends. All these items are to be deducted for the purpose of determining your net income for the purpose of the payment of the normal tax of one per cent which is imposed on incomes of \$20,000, or under. This net income having thus been determined you will take your exemption of \$3,000, if you are an unmarried man and \$4,000 if married and living with your wife. And on the balance the tax of one per cent will be computed.

I am not 20 1 to the true cow to ease so the separative which is imposed on incomes above \$20,000. If any of you are unfortunate enough to belong to that class, then you can hire a lawyer to belo you out.

All returns must be filed with the internal revenue office for the district in which you have your principal place of business on or before March 1. On or before June 1 you will receive notice from the government of the amount of your tax, and this must be paid not later than July 1. Seven penalties are provided for the failure to make returns, or for making false returns, etc.—and we all know that Uncle Sum means business, so we will try not to give him the opportunity to enforce any of these penalties.

I will take time to state only a few special points which may be of especial interest, as affecting the ordinary business man.

(1) The tax is computed on all gains, profits or income. This, however, does not include anything you receive by way of gift, or any insurance money collected. It does include any gain in values if the same is actually realized by sale, or is taken up on your books as an increase of assets. It would not include an estimated advance in value of real estate not taken up on the books.

The reverse of the same rule would apply to losses and depreciations actual or estimated.

(2) When husband and wife live together they will be allowed jointly a total exemption of \$4,000, on their aggregate income. They may make a joint return, both subscribing thereto, or if they have separate incomes they may make separate returns; but in no case can they jointly claim more than \$4,000 exemption on their aggregate income.

(3) When an individual by reason of minority, sickness or other disability, or absence from the United States, is unable to make his return, it may be made for him by his duly authorized representative. On proper excuse shown, such as absence or sickness, the collector on application and cause shown, may grant an extension of thirty days.

(4) While the gross income for the various classes or groups referred to must be set out, the particular items going to make up that group need not be set out. For instance—If any one draws two or more salaries in different capacities, he must set out the total salaries received without enumerating. Likewise as to dividends received—interest received—profits on business made. The law does not contemplate that a man shall set out the particular details as to his income except by groups.

Small Portable Mills on Large Operations

A large coal company in Kentucky has solved in a very satisfactory manner the problem of utilizing much of its slash left after lumbering operations and at the same time cheapening the cost of its mine timbers. Small portable sawmills with 8-foot carriages, such as are often employed in tie cutting, follow the logging and cut up the tops and larger limbs into mine timbers. The total weight of the plant exclusive of the 20-horsepower boiler is about 3500 pounds. It is readily dismantled and hauled from place to place on wagons. At least four weeks' supply of material is required for each set-up. A crew of four men is required to operate each mill. The saving in cost over the contract method formerly used is very marked, while the utilization is much more thorough.

It has been suggested that in sections of the country where logs are brought from the woods to the mill by rail the installation of small portable sawmill plants on flat cars which can be taken to the forest and there used for sawing very crooked logs and knotty tops into material suitable for novelty and similar work, the coarse material and very crooked and broken logs can be cut up into short lengths and stacked along the railroad track after the regular logging crew has removed the more valuable material. The small mill can then be hauled alongside the stacks, the logs elevated by power onto the car and sawed into narrow widths and short lengths, much of it choice stock.

Annual of Chicago Association

The Landether's Veso at on el-Cheago held its torty fifth annual meeting. January 19 at the Hao fron Club rooms, Cheago. Mount four hundred members and guests were present. The business meeting was preceded by a dinner, one of the most enjoyable features of which was the music rendered by thirty or more members of the Mendelssohn Club of Chicago. After the business session was concluded an exhibition of rapid fire cartoon work was given by T. W. French of the Chicago Record-Herald. Various members of the association were made the subjects on which the artist successfully exercised his skill in adding comical take-offs.

A very important matter was brought before the meeting by J. E. Rhodes, secretary of the National Lumber Manufacturers' Association. He urged that the members and companies constituting the Lumber men's Association of Chicago, take active part in the Forest Prodnets Exposition which will be held in Chicago late in April and early in May, and in New York immediately after. The speaker pointed-out the need of educating the public to the good qualities of wood, and particularly to show that for most purposes substitutes are inferior to wood. The coming expositon will be the first adequate opportunity to do this that has ever been presented to lumbermen; and more than that, there never was greater need of doing it than there is now. The speaker said that the maximum cut of lumber in the United States has apparently been passed, and there is a tendency to an increase in price, owing wholly to economic conditions-largely to longer hauls, but also to higher stumpage values which must naturally increase as years go by. The higher cost of lumber which has naturally resulted from trade conditions, has furnished the substitute people with a pretext and an argument for pushing their wares. Much of their argument is based on either misleading information or on a concealment of the real facts. It is, therefore, incumbent on lumbermen to meet the issues of that trade campaign by letting the people know that there is enough wood in the country to meet the public's needs; that, though prices have an upward tendency, it is still possible to use wood without material increased cost, provided waste is lessened by closer utilization, decay hindered by preservatives, and fire loss lessened by fire-proofing the wood. Mr. Rhodes said that these facts and many others in the same line ought to be adequately set forth by taking advantage of opportunities which the exposition

The business meeting was opened with an address by the president, Murdock MacLeod, which is in part as follows:

According to the report of the secretary the quantity of lumber received and consumed in this city during the year just passed is the greatest in its history. The facts brought out in this report, that we had in Chicago at the beginning of the year a larger stock, that the receipts during the year were greater and that the stocks left on hand at its close were smaller than in the preceding year, should convince the most pessimistic that there should be no complaint of the volume of business transacted by our members during the year that has just closed.

If there has been a depression in many of the industries throughout the country during the latter half of the year there does not seem to have been any in the lumber trade of this city so far as volume is concerned, and I believe there is no other reason than a psychological one for the depression that has existed throughout the country at large With the legislation at Washington regarding the tariff and the currency, for which the country has been waiting, an accomplished fact, and with the abundant crops for the year 1913, for which it is reported on good authority the farmers will receive from \$140,000,000,00 to \$180,000,000,00 more than they received for their 1912 crops, there can be nothing but prosperity in store for the business of the country and there should be no note sounded that is not optimistic.

The work of the association has been carried on by your board of directors and your various committees with the most cheerful and unselfish devotion to the interests and welfare of the lumber trade of this city and of the members of this association. Time forbids mention of each individual engaged in this work, but I desire to make special commendation of the work of F. B. McMullen and his associates on the entertainment committee. Charles Westcott and his membership committee, Herman H. Hettler and the members of the traffic committee Edward L. Thornton and his inspection committee. Paul Schnechel and his publicity committee, and finally of the committee which has achieved the greatest piece of work that has ever been undertaken by any commit-

to of this association during the forty-five years of its existence. I refer, of course, to Mr. Pope, Mr. Thornton and Mr. Skeele, the committee on the Lamberon's Exchange building.

I product that by the time the building is completed, on May 1, 1915, at least idnety per cent of the lumbermen having offices in the downtown district will have taken space for their offices in the Lumbermen's Exchange building at the courer of LaSalle and Madison streets.

It is with the most profound regret that I have to announce at this time the loss of seven of our associates by death during the year;—
George Farnsworth of the Oconto Company, Jan. 27; S. P. C.
Hostler, May 13; W. J. Herring of Lord Lumber Co., May 26; John A.
Nourse, June 16; J. C. Krupka of Bursik & Krupka, July 30; Ben Collins, J. Sept. 29, John Bader (4) John Bader Lumber Company and
Bader-Peterson Cook Company, Dec. 23.

Our loss of members by resignation in 1913 was in numbers only twenty six per cent of our loss in 1912. This goes to show that the slight dissatisfaction in the minds of some of our members since the association was re-organized on the present plan is passing away and argues for greater stability in its present membership. It is almost inconceivable that there should be in this city or county, in a business which develops and includes so many broad-minded men as the lumber business, a single individual who can make the claim that membership in this association is not worth to him the cost of the annual dues. Or camrations, such as this is, are mightly torics in the business world of today. No group of individuals, however talented, working singly as individuals, can accomplish a fraction of the work that those same individuals verking together for a common end can accomplish.

I want to recall to your minds the address of Harry A. Wheeler, president of the Chamber of Commerce of the United States, at our general meeting on November 25. Among other things he said, "You cannot build a wall around your own business any more and succeed in making progress. The member of your association who at the end of the year will resign and say it is no good to him is the man who does not act with the men who are doing things for their line of trade. The man who comes around, gets into the game and studies with his fellows the needs of the business will never resign.

For the purpose of extending further the work of this association, we resolved at that meeting to become affiliated with the Chamber of Commerce of the United States and your board of directors has appointed a delegate to represent this association at its general meetings during the year.

As indicated by the reports of the chairmen of the different divisions, while some divisions held regular meetings others have not been as active as they might be, the reason doubtless being the unsettled condition of the market during the latter half of the year and the seeming futility of discussing these conditions. This is a condition which should be remedied by the incoming administration.

In conclusion I wish to express my thanks for and appreciation of the uniformly kind and loyal support of the board of directors during the year and for the ever willing cooperation and assistance of the members of the different committees and their chairmen, and last but not least of our ever faithful secretary. Edwin E. Hooper. I regard his work as invaluable to the association. He is now serving his twenty-sixth year in his present position and I would wish him nothing worse than to continue his services for twenty-six years more.

The address by the secretary, E. E. Hooper, dealt largely with statistics relating to the business of the association. It was shown that the total receipts of lumber, etc., at Chicago during the year 1913 aggregated, according to the best data obtainable, 2,804,276,000 feet of lumber, 507,796,000 shingles by rail and lake, and by lake 103,450 lath, 36,740 cedar posts, 250,925 railroad ties. Of the figures given 240,276,000 feet lumber and timber were reported from the U. S. custom house as lake receipts, leaving 2,564,000,000 feet of lumber and 507,796,000 shingles to represent receipts by rail. The total volume of receipts shows an increase in lumber of 133,580,000 feet for the year 1913 and in shingles 6,145,000.

Following is an analysis of the disposition of lumber and shingles at Chicago for 1913 and 1912 for comparison.

LUMBER.

Inventory at 1 ginning of ver-THE SHIP OF THE 504 654 000 Receipts during year 507 796 000 Sales and shipments 519 195 950 54 045 250 60.684.500 Stocks on hand at close of year

About 70 per cent of this large volume of receipts is estimated to rep-

resent yellow pine hardwood and Pici c Coast lumber

The hardwood vards, from the best information at hand, show stocks on hand to be larger this year than last, estimating from some reports received, that they had about one hundred millions in their vards on Jan 1, 1914. The past season was the banner year in the Chicago lumber market, which continues to be the largest in the world. It requires the cutting of timber from about 450,000 acres for this market alone, and 180,000 cars to transport the lumber, which would make a solid train of lumber 1,400 miles long.

The building construction in Chicago was larger in 1913 than in the preceding year.

The election of directors and committeemen resulted as follows: Board of Directors: Div "A" L. W. Crow; Div "B" Theo. Fathaner; Div "C" S. C. Bennett; Div "D" F. J. Pike: Div. "E" F. R. Gadd; Div "F" F. L. Johnson: Div "G" Geo. P. Rinn; Div "II"-Louis Carson.

COMMITTEE ON ARBITRATION | T. J. Heitmann, Fred D. Smith, F. B. McMullen, C. B. Flinn, E. A. Lang, H. D. Traeger

COMMITTEE ON APPEALS: M. F. Rittenhouse, Chas. Darling, Geo. D. Griffith, C. A. Marsh, Murdock MacLeod, John Olsen, Jr.

The report of the an interstal countries showed that the entoil ment January 1, 1913, was 187; new members during the year nine teen; lost by death, three; lost by resignation, nine; total enroll ment January 1, 1914, was 194. It was urged that efforts be made to increase the membership as there are still a number of good con-

A summary of work done in 1913 includes thirteen meetings by the board of directors. A quorum was present at every meeting. The association held five general meetings and an outing. A bulletin board was installed in the association rooms for listing stocks for sale and wanted

The building committee, consisting of George J. Pope, E. A. Thornton, and E. E. Skelle, read a report showing the present status of the proposition to erect the Lumber Exchange Building on the site of the old Roanoke building, corner of Madison and La Salle streets. Negotiations have been so far completed as to warrant the owner, the estate of S. J. McCormick, to proceed with the erection of the building. Many lumbermen with headquarters in Chicago have signified their willingness to sign five year leases for offices; and steps are now under way to have all necessary contracts and other papers signed in the immediate future. It is expected that the building will be ready for occupancy early in 1915.

The association, by resolution of the board of directors, invited the lumbermen of Missouri, who were recently not only fined, but in many cases ousted from the state, to make their headquarters in this city, and especially in the Lumbermen's Exchange building. The letters in reply have been very encouraging and it may develop that one or more of the large yellow pine companies will find it to their advantage to make their headquarters in Chicago.

🕏 Wood-Using Industries of New York 💥

A valuable report on the wood-using industries of New York for the year ending July 1, 1912, has been published by the Syracuse University. The work was done under a co-operative agreement between the New York State College of Forestry and the United States Forest Service. The field work was carried out by Nelson C. Brown and Edward F. McCarthy of the state of New York, and John T. Harris, representing the Forest Service.

New York exceeds every other state in the amount of wood used in factories, with the exception of Illinois, which uses about 27,000,000 feet more in a year. There is pretty close agreement between the two states in the number of woods reported, but Illinois is slightly in the lead with eighty four to New York's eighty-three. In total cost of wood delivered at the factories, however. New York leads with \$53,969,905, compared with \$51,-229,693 for Illinois. The average cost of all lumber at Illinois factories is \$28.76 per thousand feet, and \$30.76 in New York; but the latter state outdistances Illinois in the amount of lumber cut from state grown forests. Nearly one-third of what New York factories use is grown in the state, while Illinois grows less than two per cent of what its factories buy.

The uses of wood in New York are greatly diversified. There are forty-six industries specially reported, besides a number grouped as miscellaneous. Aeroplane manufacturers are the newest in the field and are the smallest in point of quantity of material used. Planing mill products are the largest industry; eigar boxes demand the highest priced lumber, considering the whole amount used, and excelsior the cheapest. Sixteen woods are bought by weight and it is somewhat difficult to reduce their cost to the board measure scale. The American woods bought by weight are haw, orange and peach.

Of the eighty-three woods used, twenty-seven come from other countries. The foreign wood bought in largest amount is mahogany, 11,208,720 feet. This exceeds the amount of this wood manufactured yearly in any other state. Its average price is \$138.84 per thousand feet. Spanish cedar is second of the foreign woods in the annual demand; but New York uses less of it than Florida. However, the manufacturers in the Empire State pay a total of \$970,798 for what Spanish cedar they buy, or \$113.11 a thousand feet, while the annual cost in Florida is only \$254,185, or \$24.95 a thousand. The difference is due principally to the fact that in Florida the wood is bought in the log while the factories in New York purchase it in finely-sorted veneers.

The highest priced wood reported in New York is English oak at \$341.34 a thousand; vermilion second at \$300; Circassian walnut third at \$267.22, and teak fourth at \$262.42. The cheapest foreign wood is balsa or corkwood at \$40.

The native wood bought in largest amount is white pine, 422, 686,634 feet at an average price of \$27.70. Nearly one-fourth of all the wood used in the state is this pine. Spruce, including both eastern and western species, stands second, 169,107,607 feet, at an average cost of \$21.31. White oak, including several species, is third, and the annual purchases reach 130,421,577 feet, at an average cost of \$46.25. The purchases of various red oaks aggregate 59,868,300 feet, the average cost of which is \$38.49. The southern yellow pine, hemlock, and western pines, cedars, and firs contribute largely to the annual supply of lumber in the state. In addition to the oaks mentioned, the important hardwoods listed are maple, chestnut, yellow poplar, basswood, birch, beach, red gum, cottonwood, and twenty others used in smaller amounts.

The table which follows lists the forty-six industries and gives statistics concerning amounts of wood used by each, cost, etc.

SUMMARY OF WOODS USED BY INDUSTRIES IN NEW YORK

	Quantity used annually	
Industry.	Feet b. m.	1,000 ft.
Planing mill products	388,191,660	\$27,30
Boxes and crates, packing		21.73
Sash, doors, blinds and general mill work		33.87

Printing material	1,737,500	37.76
Rollers (shade and map)	1,622,500	35.88
Brushes and brooms	1.562,500	24.40
Shuttles, spools and bobbins	962,000	21.02
Pulleys and conveyors	823,000	46.45
Dowels	753,000	34.38
Gates and fencing	725.500	26,80
Signs and supplies	599,500	28.11
Firearms	370,000	68.67
Equipment, playground	250,000	36.28
Aeroplanes	31,400	30.83
Miscellaneous		29.80
MISCERARCORS		20.00
Total	.754,519,217	\$30.75

There is a great deal of material in the report well worth close study. No summary in a brief review can do it justice. The original forests of New York were among the finest in the world, but like those of most other states they were used or destroyed without much thought of the future. In recent years the people of the state have been brought to a realization of the mistakes of the past, and they have gone to work to provide such remedies as appear practicable. New York has spent and is spending more money than any other state in planting denuded land, buying waste tracts, and protecting remaining forests against fire and vandals. The undertaking is an enormous one, but it is being approached in the right way. The state is supporting a high-class forest school at Syracuse and is preparing men to take charge of the ever-increasing forestry work on the lands belonging to the state as well as on areas privately owned. The high-class service that is being rendered by these men is shown, in part, by the report just published which, as stated above, is a co-operative work between the United States Forest Service and the state of New York. It is the most comprehensive state wood-using report yet issued, embracing 214 pages, and covering the subject historically as well as with statistics.

Wood to the amount of 1,750,000,000 feet is yearly demanded by manufacturers in the state. This comes from the four quarters of the earth. About one-third of it is cut in the forests of the state, and it may be expected that the quantity of state grown timber will increase rather than diminish from now on. Depletion and destruction of the forests have passed their lowest point. Planted lots and protected forests will gradually increase their yield until the state shall have little need of outside supplies.

The whole utilization of wood in New York is not shown in the total 1,751,519,217 feet given in the foregoing table. To this should be added pulpwood, cooperage, veneers and wood distillation which consumes at least 1,000,000,000 feet annually in New York. This would raise the total annual consumption of wood by manufacturers to not much below 3,000,000,000 feet. It is estimated that when from 12,000,000 to 14,000,000 acres of land in the state, which is better suited to forests than to anything else, is well covered with trees it will nearly or quite supply the demand for wood.

The Currency Bill and Business

In a recent address before a convention of the Manufacturers' Association at Trenton, N. J., William C. Cornwell discussed the relation of the new currency bill to the country's business. Some of the points made by the speaker follow:

There is little doubt that practically all the national banks of the country will join the Federal Reserve organization, and probably a very large number of state banks and trust companies will eventually become members.

The good effects of the change will not appear at once, as the organization of the system and its reduction to smooth working basis will occupy a considerable period. Three great benefits will, however, when this is done, be brought to the country by the measure.

First. The reserves, heretofore scattered and useless, except as weak individual defenses in case of panic, are piled up at a few instead of many points, and under one control will serve as efficient protection against disaster.

Special The millions in good commercial paper, heretofore compelled mainly to be held useless in bank vaults until maturity, will be rendered promptly negotiable.

THIRD: An elastic currency is created, intended automatically to respond to the legitimate demands of sound business, abolishing forever the annual crop-moving money-squeeze and the alternate summer surfeit of funds at the great cities.

In a great crop-raising country, the heavy demand of the year for money comes in the fall, when funds in large volume to move the crops have to be sent to the fields by the bankers. Consequently, always in the United States, as the fall season has approached, the banks have tightened up their pursestrings in preparation for this annual outsending of money and frequently have had to draw upon Europe to tide over the emergency. The manager of any business concern which is a borrower, and most concerns are borrowers at one time or another during the year, knows the uncomfortable feeling of having his banker, no matter how good the credit of the borrower, request him, politely or otherwise, to get along with as little as possible. This conversation takes place usually in the autumn, because every year the bankers at the reserve cities, have, as has been said, to send out in actual funds to move the crops up to around \$150,000,000 from their reserves, and this usually means a calling of loans up to about four times the amount, or 500 or 600 millions of This operation descends like a wet blanket on all the business undertakings of the country, and the damp conditions continue until the crop is on its way to be turned into money for the recuperation of the reserves.

Under the new law, this annual fall money squeeze will be a thing of the past. This is because when the need for funds in the fields commences, the banks of the West and South will merely have to send to their regional reserve banks commercial paper to the amount of currency needed, and the federal bank notes will be shipped to them, without charge, over night. Their own loans to commercial borrowers will be undisturbed, the reserve banks and central reserve banks will not be called upon for a penny, and the business of the country, as far as it depends upon loans, may go on absolutely undisturbed.

Some business managers hanker so for a row that they will go to lots of trouble just to find something to fuss about when they might find something to be pleased with without any trouble at all,

"(If') is the universal stumbling block the average man points to when he comes to a business cropper or fails in something he expected to do.

The hardwood trade pays each year quite a lot of freight on moistere because lots of millmen shy at the idea of putting in a dry kiln.

There may be 50 per cent of waste in manufacturing narrow hardwood and parquetry flooring but this product helps save a lot that might otherwise be waste for the mill man.

Pertinent Legal Findings

OPERATION OF TEXAS LIEN LAW

Specific Texts constituted in the sign had to make them show to, in a large to the effective as proceed by activities and of the constitution of the configuration of the statutes as the sentence of the comply with the statutes of the sentence of the statutes of the statutes of the statute of the chargest and most satisfactory was no follow the statutery provisions. In nearly all, if not all, the other states, the courts hold that all the requirements of the lien laws must be substantially followed in order to preserve a lien.

SUFFICIENCY OF LIEN STATEMENT

When building materials are sold under an agreement that a peasonable price shall be paid for the whole lot, in lieu of item/red prices originally agreed upon, a statement for a mechanic's lieu need not specify the prices for the various items. Missouri Court of Appeals, National Press Prick Company vs. W. H. Lester Construction Company, 160 Southwestern Reporter 1075.

WAIVER OF DAMAGES FOR DELAY IN DELIVERY

Although a buyer of lumber will be deemed to have waived any claim of damages resulting from the sello's delay in making delivery, when intent to waive clearly appears, no waiver arises from the mere fact that the buyer accepts a partial delivery after the time when the lumber should have been delivered, especially where the buyer has frequently drawn the seller's attention to loss occasioned by the delay. (Washington Supreme Court, Wisconsin Lamber Company vs. Pacific Tank & Silo Company, 136 Pacific Reporter 691.

ADEQUACY OF GUARD ON CIRCULAR SAW

In a sait for personal injury to a ripsaw operator, it was open to the jury to find that defendant employer was guilty of negligence in failing to provide a spreader, the accident having resulted from a kicking back of a board which the workman was sawing, although the machine was equipped with a hood, which proved cumbersome and inadequate for the work of sawing polished wood. (Washington Supreme Court, Jensen vs. Shaw Show Case Company, 136 Pacific Reporter 698.)

LUMBER ROAD AS "RAILROAD"

Independently of statute an employer is generally held not to be liable for injury to an employe resulting from negligence of a co-employe in the same department of service, unless the latter has been habitually so negligent that the employer was guilty of negligence in retaining him. By a statute in force in North Carolina this rule is abrogated as to "railroad" employes in eharge of machinery, so that negligence of a co-employe is no defense to a suit for personal injury. By a late decision of the North Carolina supreme court, this law is held to extend to lumber companies so far as concerns the operation by them of railroads in transacting their business. (Buckner vs. Madison County Railroad Company, 80 Southeastern Reporter 225.)

RESCISSION OF A CONTRACT OF SALE

Where a buyer of lumber, after paying part of the price, rejected delivery, the seller implicitly agreed to a rescission of the contract by directing prompt reshipment, and the buyer became entitled to reimbursement for the amount paid on the price, and, also, for the amount of the return freight charges; it appearing that the seller did not object when notified by the buyer that the latter would claim reimbursement on account of freight charges. The seller could not legally refuse to accept a return of the lumber, after having directed its reshipment, merely because each piece had been marked across the head with red paint,

maneating that it was a salable, where the marks could have been scraped or ent off without many to the lumber at a small expense, which the buyer consented to pay. Pending settlement of the dispute between the partness relative to reimbursement of the buyer he was entitled to retain possession of the lumber. South Carolina Supreme Court, Treyler vs. Wilson, 80 Southeastern Reporter 250.

WAIVER OF BREACH OF WARRANTY OF MACHINE

A lumber company which bought a planing machine under warranty as to its efficiency waived right to rely upon a defective condition of the machine arising from the fact that the pressure bar failed to keep the lumber down, where the machine was sold under a contract which provided that the company's retention of the machine for thirty days should constitute an acceptance of it. (Alabama Supreme Court, Berlin Machine Works vs. Ewart Learer Gengary, ed. Southern Reporte 167.

RIGHT LIEN FOR MATERIAL USED FOR RECONSTRUCTION

One who turnishes material for the construction of a building which is partly burned in the course of its erection is enitled to enforce a lien for the price of such material, as well as for additional material furnished to reconstruct the structure. (Nebraska Supreme Court, Lincoln Savings & Loan Association vs. Webber, 14° Northwester: Reporter 245.

RESPONSIBILITY FOR NEGLIGENCE OF CO-EMPLOYE

A lumber company is not liable for injury to an employe while handling boards, caused by negligence of a co-employe, where the latter had not been habitually so incompetent or careless that that employer can be regarded as guilty of negligence in retaining him in employment. Mere inexperience or a single negligent act does not establish incompetency on the part of a worker within the rule of law which requires every employer to use due care to furnish competent fellow workmen. (Wisconsin Supreme Court, Szelikicki vs. Conner Lumber & Land Company, 144 Northwestern Reporter 255.)

EMPLOYE'S DUTY TO INSPECT APPLIANCES

A woodworker engaged to operate machinery is under no duty to inspect it to discover defects which may cause injury to him, being entitled to assume that his employer has discharged his duty to use reasonable care to provide reasonably safe appliances. (Texas Court of Civil Appeals, T. B. Allen & Company vs. Shook, 160 Southwestern Reporter 1991.)

MISQUOTATION OF PRICE THROUGH MISTAKE

When an offer to sell hardwood lumber, through clerical error, quotes a lower price than the seller intended to quote, and is accepted by the person to whom it is made, is the seller bound by the contract thus formed by such offer and acceptance? The courts of all the states have repeatedly held that, in such a case, the seller cannot excuse refusal to deliver at the price named, on the ground of mistake, where there was nothing to put the buyer on notice that a mistake was made. But the Texas court of civil appeals has just handed down an opinion which shows that this is not the law, if the buyer has intimation that a mistake was made. This decision applies to sales of all kinds of commodities which have a market value, although it was announced in a case which was based on a contract to sell seed. A seed company in Texas offered to sell a quantity of millet seed at \$1,35 the hundredweight, at a time when the market value was \$2.35; that being the price which the seller intended to quote. On receiving the offer as written, a Kansas seed house immediately wired, "We accept your letter seventeenth. Ship quick." Having discovered the mistake, the Texas company refused to make devilery of the seed, and the Kansas concern brought suit to recover damages on the theory of a breach of contract. In denying the right of recovery the court of civil appeals said, in part: "Ordinarily, when the mistake is not

restrictions, to will cotacleve the party making it against leaves (2.1.2) for a statistion; but we think a sufferent too should apply when the evidence shows that the party accepting the mistaken offer knows of the mistake when he accepted it, and that he should not reap the benefit of the mistake to the evident injury of the other. We think fair dealing and good conscience should require an opportunity to correct the error, before trying to found a binding contract on it. * * * * The evidence in this case is that both parties knew the market value of the millet seed on April 17, 1912. Upon receiving a letter from a dealer

or that commontry, appellant must have known that \$1 per hundredweight less than the market value was a mistake. That they did is evidenced by the telegram to "Ship quick." It did not wire back that "Your \$1.35 per cwt. offer is accepted." Appellee thought that it had quoted the market price in the letter \$2.35. We think from the evidence it is manifest that appellant knew a mistake had been made, and sought to take advantage of the mistake by an immediate acceptance and quick holyantage of the mistake by an immediate acceptance accompanied by the regress that the shipment of the seed by made at once.

Ash Timbers of Commerce

In commercial transactions timbers are usually grouped. E.g., or ten species of hickory, as botanists know them, are all one in the lumber yard. Fifty kinds of oak trees make two kinds of lumber, white oak and red oak. Four or five kinds of elm fall into two classes, frequently only one, in the lumber yard. Three species of basswood become simply basswood lumber in the yard and factory. From two to five kinds of birches pass as one in the lumber trade. The softwoods, meluding pines, cedars, spruces, firs and others, are less numerous than the hardwoods; but the same system of grouping is observed. It would tax the observation powers of the most experienced lumberman to tell whether the spruce he handles in a Chicago yard was cut from black, red, white, Sitka, or Engelmann spruce, though if he could see the standing trees he could readily tell one from another.

Ash trees constitute an important group, but the lumber generally goes to market without much effort to distinguish one kind from another. A wood technologist with his microscope and "key?" can work them out and explain wherein one differs from another; but turn him loose in a lumber yard, and he would have a hard time picking out and identifying the boards sawed from different species. There are different qualities of ash, but differences as great may be found between the woods of trees of the same species as between those of different species. It is largely a matter of soil and situation.

The term "second growth" when applied to ash lumber means only that the wood has wide growth rings, and is regular in grain. That is the principal meaning of "second growth" applied to any wood in the market. It may be supposed to mean a young tree which has grown since the primeval forest was removed; but it would take a pretty good judge of lumber to tell where a tree grew, simply by looking at the boards. The term "second growth" is much abused, intentionally or unintentionally. If the terms "rapid growth" were substituted for "second growth" it would have a specific meaning. Wide annual rings are proof of rapid growth, but not of second growth. Woods which have grown rapidly are usually stronger than those of slow growth, but not necessarily so. Several things must be taken into consideration before a concrete statement to that effect can be made concerning any wood.

Fifteen species of ash occur in the United States. There are probably not a dozen living men who have seen the trees of all of them; and if all could be found growing on a single acre, it is doubtful if any man, except a few systematic botanists, could correctly name each of the fifteen species offhand, and it would tax the best botanist to do it. In addition to the fifteen species of ash in this country, there are several varieties, in which lumbermen have no special interest.

White ash (Fraxinus americana) is the most important tree of the whole group. It is often called gray ash. Its range extends from Nova Scotia to Minnesota, and south to Texas and Florida. It is probable that the lumber cut from this ash exceeds the combined cut from the other fourteen species.

Black ash (Fraxinus nigra) is so named because of its large, black buds in winter; but the heart wood of certain trees is pretty dark and some persons name it for that reason. The coarse, blunt twigs distinguish this tree from the white, red, green, and blue ashes; but the color and roughness of the bark vary greatly. Two black ash tree's stand side by side in Lincoln park, Chicago, which are so different in appearance, when bare of leaves, that relationship is not apparent, except for the telltale buds. The tree ranges from Newfoundland to Manitoba, and south to Delaware and Arkansas. The tree's crushed leaves emit the odor of elder. The wood is valuable,

Blue ash (Frazinis quodrangulata) is easily identified by its square twigs, particularly when trees are young. It is named on account of a blue dye obtained from the inner bark. Its range lies in the lower Ohio and Mississippi valleys, and among the mountains of eastern Tennessee. The wood is heavy and strong, and manufacturers of agricultural tool handles prize it highly.

Green ash (Fraxinus lanceolata) has a wider range than any other ash of this country. It occurs from Vermont to Utah, north in vanada, and south to Florida and Arizona. It has been extensively planted for shade and ornament in most parts of its range, particularly in the Plains states. The name refers to the foliage, though the leaves are no deeper green than those of some other ashes. The wood is of good quality, but no great quantity of it goes to market. The form of the tree and the quality of the wood closely resemble red ash.

Red ash (Fraxinus pennsylvanica) is neither a large tree nor very abundant, though its range extends from New Bruuswick to Dakota and south to Florida and Alabama. It has many names in various localities. The inner bark is reddish, and the same tinge occurs on small twigs and the under side of leaves, and this characteristic gives the tree its common name. It is a rather small tree and the wood is not usually regarded quite the equal of white ash.

Oregon ash (Fraxinus oregona) is a Pacific coast tree which occurs from Oregon to Mexico. It is not abundant, and only in exceptionally favorable situations do trunks grow in form and of size suitable for lumber. The tree is not of much commercial importance, and would be of still less if hardwoods were not so scarce on the Pacific coast.

The foregoing six species furnish nearly all the ash lumber that goes to market in this country, but nine others are found, and logs from some of them occasionally find their way to sawmills.

Texas ash (Fraxinus texensis), as might be inferred from its name, belongs in Texas. Its range extends from Dallas to Devil's river. Trees are usually of small size and poor form, but the wood is of good quality and is put to various uses in localities where it

Florida ash (Fraxinus floridana) is a small tree with a trunk a few unches in diameter. It occurs in the swamps of southern Georgia and Florida. It is of no commercial importance.

Biltmore ash (Fraxinus biltmoreana) takes its name from Biltmore, N. C., but it grows in West Virginia, Indiana, Tennessee, Georgia and Alabama. Trunks seldom exceed a foot in diameter, and the wood has few reported uses.

Water ash (Fraxinus caroliniana) occurs in deep swamps from Virginia to Florida and westward to Texas. The wood is light in weight and in color, and is weak. It weighs less than white pine.

Trees are small, scarce, and of production will no value for lauber.

Pumpkin ash Fraxious persons we know the subject of considerable discussion by persons we know either about it. The name has been assigned to the some only east to term plan pare? To soft, homogeneous wood which cuts easily in all directions like a pumpkin. That is simply a gress for a very poor one. The wood has no such character and the name has nothing to do with the wood. The tree grows in deep swamps and like many other swamp trees it has an enlarged base, which is a provision of nature to give the tree anchorage in the soft mud, the enlarged base is ribbed like a pumpkin, hence the name. The tree is remarkably scarce. It was unknown to botanists before 1893, though the region where it grows had been settled more than a hundred years. Trees are known to exist in certain swamps in Missoir. Atkansas and Florida. It is needless to say that this ash is of no commercial importance.

Berlandier ash (Frazinus berlandieriana) now grows wild in western Texas, but it was probably not planted there by nature. It is supposed to have been brought over from Mexico by early settlers. It is scarce, but it grows well and may attain importance in the future. In Mexico it reaches a diameter of six or eight feet.

Leatherleaf ash Frageons of a a is a descriptive found in

canyons from western Texas to eastern California. Few trunks are eight inches in diameter, and the wood is not strong. It would possess little value at it did not grow in an arid region where any wood is welcome. It is one of the best handle woods of that part of the country.

Dwart ash (Frances accounts) would puzzle mest people who might find it in the woods. The compound leat, characteristic of all other species of ash, is missing trom this. A simple leaf is in its place. No one would take the tree for an ash until the seeds betray its identity. It is a desert species, of small trunk, which never goes to sawnills. The range lies in Colorado, Utah and Nevada.

Fringe ash *Fraziens cuspidata* is the smallest ash tree of this country, and some would not call it a tree but a shrab. Trunks never exceed a tew inches in diameter. Its range his from Texas to Arigana.

Thirty nine states are credited in statistical reports with production of ash hunder, but more than a third of the whole comes from Ohio, Indiana, Arkansas and Wisconsin. States which report none are Arizona, Colorado, Idaho, Montana, Nebraska, Nevada, New Mexico, Utah, and Wyoming. The country's total asi, product or of lumber in 1911 was 214,398,600 test.

Wood Preservers' Meeting

The tenth annual meeting of the American Wood Preservers' Association was held at the St. Charles Hotel, New Orleans, January 20, 21 and 22. A. E. Larkin, the president, was in the chair and introduced Mayor Behrman who delivered the address of welcome, to which the first vice-president, J. H. Waterman, responded. The Louisiana Society of Engineers, through its president A. M. Shaw, welcomed the visitors on behalf of that body.

At the conclusion of this preliminary part of the program, the annual address of the president was listened to. He urged the desirability of a better method of distributing data, and suggested the publication of a monthly bulletin as a means of giving information to those entitled to it.

The entertainment committee provided abundantly for the pleasure of the attending members, without seriously interfering with the transaction of the business of the meetings.

The association's membership is now 187 compared with 157 last year. It had twenty members in 1904 and has grown steadily ever since, the increase being much more rapid in late years than when the association was in its infancy; and the figures clearly indicate that the body has not yet attained full growth. More than half of the original membership of the year 1904 is still with the association. The present membership is scattered through thirty-one states and five foreign countries. Forty-seven of the members are railroad men.

The president appointed a committee on resolutions, consisting of E. A. Sterling, J. Foley, M. K. Turnbull, H. F. Collier, and J. H. Waterman. Mr. Turnbull was named as chairman.

A paper by Dr. Hermann Von Schrenk on "Creosote and Coal Tar Mixtures" was illustrated with stereopticon views by which were shown tests made with oils and mixtures, to determine their viscosity, evaporation, and their results as shown by impregnation of various woods. The tests showed, he contended, remarkable variations in the matter of penetrability and he said there was no criterion whereby the effects of certain standard mixtures could be measured and compared with those of the unmixed oil. The reading of this paper caused a discussion in which a number of members joined.

A report on piling belonging to the Santa Fe railroad in Galveston bay was read at the Wednesday morning session by F. B. Ridgeway of the International Creosoting Company, at Texarkana, Ark. He presented specimens of piling driven in 1875 when creosoting was in its infancy, and others not so old by twenty years, where decay had not destroyed ten per cent of timbers.

A paper on the subject of fireproofing wood was written by Robert E. Prince, of the Forest Products Laboratory, Madison, Wis., and

in his absence was read by Secretary Angier of the association. He quoted figures showing fire losses in various foreign countries, and when these are compared with similar statistics for the United States it is apparent that destruction of property by fire in this country greatly exceeds the average in most other countries. The only two which suffer greater per capita loss than the United States are Canada and Argentina. In the United States the fire damage in 1912 was \$2.55 per capita. In no European country did it reach \$1, while in Germany it was 20 cents, in Sweden 13, the Netherlands 12, and in Switzerland only 4 cents.

The fireproofing of wood is not a new subject. Until the latter part of the last century wood preservation and fireproofing both occupied a precarious position in the business world. While the preservation of timber against decay is now well established, its preservation against destruction by fire has made much slower progress. In this country the industry of fireproofing wood, or of rendering it slow burning is confined to two companies, both of which are located in New York City. The total annual output of these two plants is less than that of a timber treating plant of average capacity. This fireproofed wood is used mainly as trim and flooring in building in New York City.

The agitation about fireproof building material in the United States has resulted in a number of cities passing laws prohibiting the use of inflammable material in the exterior of buildings, and the result is the sale of wood shingles in those cities has fallen off perceptibly, as shingle manufacturers cannot guarantee their product to be fireproof or fire retarding. The consumption of other forms of wood building material has also suffered from laws of this kind.

The possibility of treating wood to render it fire resistant offers an excellent field for extending the business of wood-preserving plants. Should a satisfactory treatment be found such plants could, with a slight increase in equipment, handle both forms of treatment. The ideal treatment would, of course, give wood both qualities.

The impregnation of wood with some fireproofing salt appears to be the most promising method of rendering it noninflammable. Thecost of a treatment of this character, exclusive of kiln drying, may be roughly estimated as the same as the cost of a full-cell treatment with a high-grade coal-tar creosote.

The main problem is not to find suitable fireproofing materials, but to bring the cost within reach of users. The combustion of wood may be divided into two parts:

FIRST. The driving off of the volatile gases by heat, and their ignition causing flame.

Since p_{ij} , we confinstion of the nonvolatile portions, analogous to p_{ij} , p_{ij} , p_{ij} and the production of carbon states p_{ij} .

It will readily be seen that the first part of the combustion is the seen that the first part of the combustion is to render the volutile cases manipulationable.

It has been found that the chemicals most efficient in rendering wood normalization are those that sublime or decompose upon being scheected to intense heat. Noncombustible gases are given off in both cases, which, when nixed with the inflammable gases arising tree. The contract of them containmable.

A method used in previous fireproofing work has been to inject chemicals containing large amounts of water of crystallization, the theory teng that the water is converted into steam which creates a noninflationable atmosphere without the wood. Under this method borax and alion were used. Borax also has the advantage of being a fusible salt, thereby protecting the wood fiber with a glossy coating. The manufacture of fire retarding paints also offers a very attractive fold of the salt.

The paper describes the various chemicals used in the treatments, and the methods of making the tests to determine how great a degree of heat the woods will resist. The woods used in this work were representative samples of the material found in structural timbers. Four species were natives of western and five of eastern United States. Of the western woods tested, western larch and noble fir withstood the action of the various degrees of heat used in the test without igniting longer than redwood or Sitka spruce. The average per cent loss in weight of each species due to burning three minutes was calculated from all the pieces in the test. The results follow:

1	Per cent, Loss in	Weight
West in Woods	Oven Dry	Air Dry
Sitha spruo	25.6	314.5
Larch		35)
Redwood	23.2	27.0
Noble fir	08.8	21.9
Eastern Woods		
Longleaf june	16.7	16.0
Tamarack	22.4	20.28
Basswood	48.6	36.0
Red oak	5.9.0	29.5
Hemlock	30.0	30.5

The writer summarizes the results of tests as follows:

Ammonium salts are of considerable value in fireproofing wood. It was impossible to ignite wood, under our conditions of test, that had been treated with these salts.

Borax is of considerable value in fireproofing wood. It has not the value of the ammodium salts, but promises a means of lessening the cost of treating by using it with another salt of greater value.

From the good results already obtained it appears possible to devise a reasonably inexpensive method of rendering wood fire-retarding.

A paper was read by Clyde H. Teesdale of the Forest Products Laboratory, Madison, Wis., the subject being: "The Effect of Varying the Preliminary Air Pressure in Treating Ties Upon the Absorption and Penetration of Creosote." The paper covers twenty printed pages and enters minutely into the processes and results of various treatments.

E. L. Powell, vice-president of the American Creosote Works, delivered an address on "Treatment of Piling and Timber According to Conditions of Use and Exposure." He summed up his conclusions by saying that the amount of preservative required is directly affected by the kind of soil, whether wet or dry, and climate in which the timber is to be used, as well as by the character of timber to be treated and the mechanical wear to which it will be subjected.

Ties, piling and lumber to be used in hot, wet countries require a different treatment from ties to be used in a cold climate or arid region. The treatment of such timbers to be used in teredo-infected salt water must be radically different from timber used in fresh water, swamp land, cold or arid regions.

It should be possible for the treating company to secure full information concerning the conditions under which the material is to be used, and, if necessary, the company should refuse the business unless the buyer is willing to have the material treated properly and sufficiently. At least the buyer should be fully informed of what is needed and the information should be in writing to prevent future troubles when failure of the timber occurs.

The reputation is a '++ bresperity of the wood preserver depend upon good work not only his own, but upon what is done by others, so all are vitally interested. The good work that is turned out is a constant advocate, and bad or unsatisfactory material hurts the business as a whole, though it injuries the responsible plant most directly.

A manufacturer of machinery, for instance, would certainly refuse to build apparatus that he knew would fail to operate successfully, but would submit to his customer the facts and proper plans and recommendations. He could not afford to send out bad machinery at any price.

The buyer will usually appreciate the information and a correction can be made without causing friction or hard feeling. It is generally good policy to handle this in a personal interview with the engineer. He can then send the required amendment without having to publish his error if he so desires.

The economy resulting from piling crossoted wood blocks closely in cages was the subject of the paper read by R. H. White, president of the Southern Wood Preserving Company of Atlanta, Ga.

Thomas White, assistant manager of the American Creosote Works, described some of the methods he had found effective in separating water from creosote oil.

Mechanical principles which should be observed in laying crossoted wood block pavements to lessen the effect of wear and minimize the trouble due to the expansion of the blocks, were discussed in the address delivered by R. S. Manley, president of the Crossoted Wood Block Paving Company of New Orleans,

The paper read by J. B. Card, manager of the Chicago Creosoting company of Terre Haute, Ind., discussed a patented apparatus which was said to treat paying blocks much more cheaply than can be done with the old-style horizontal cylinder. Two tanks eleven feet in diameter and fourteen feet high are used, together with specially-designed methods of handling the blocks. Some of the advantages claimed for this style of plant follow:

The cest of a complete plant would not exceed one third of the cest of a horizontal plant of the same capacity.

It eliminates all switching and handling of block cars and loading. When built in connection with a tic treating plant the cost is but very little more than the block cars necessary to run a horizontal plant, the cost of these tanks being about \$3,000 cach, set up.

You can increase your tie business and also your block business, and run them independently of one another. The same force of engineers, firemen, superintendent, etc., will do the work.

The cost of maintenance of this type of plant is very small. There is nothing to wear out. The cylinders will last for years.

A small amount of ground room is required, as there is no block car switching.

It will manufacture and treat paving blocks for a less cost per yard than any horizontal plant.

S. R. Church, manager of the research department of the Barrett Manufacturing Company, addressed the meeting on the subject of wood paving in Europe compared with the work done in this country. He recounted chiefly his personal observations while traveling in England, France, and Germany. He had much to say in commendation of pavement in England, but not so much for what he saw in Paris and Berlin. The French give their blocks open tank treatment which secures such superficial penetration that the pavement does not last long. The English do the work more thoroughly and obtain better service. The speaker commented on the almost total absence of shrinking and swelling of the blocks in English pavements and attributed it not to any superiority of seasoning or treating, but to the climate. Such a thing as a dry spell of weather is practically unknown in England. There is a little rain nearly all the time, and the wooden blocks are constantly soaked and of course do not shrink or swell as they would do in a climate of great variation in dampness and dryness.

The use of Australian hardwoods is practically a thing of the past in European paving. Pine from the region of the Baltic Sea is now popular, and Mr. Church regards it as a very superior paving wood, when it has been properly treated with preservatives.

The supply of railroad ties, their treatment to lessen decay, and their handling where large numbers must be cared for, as well as devices to prevent excessive mechanical wear, were the subjects of profitable addresses and discussion.

Lambert T. Erieson, assistant's perintendent of the Port Reading Creosoting plant, presented a poper on the mechanical handling of radroad crossties and timbers at preservation plants. There are, he said, a number of items to be considered. The condition of large quantities to be stored in limited areas and in limited periods of time, is a common one.

Besides the common conditions of limited areas for storage and the receipt of great quantities of material in bunches, so to speak, there is the common co-ordinate difficulty of obtaining the necessary labor to meet the fluctuating demands. The problem of keeping down the cost of handling comes in at this point. Where manual labor is depended upon entirely, it is necessary to have men skilled in their work, in order to keep the cost down to the regular piece work (atc. And when unskilled men are used, the cost of the handling goes up very materially. That is true more on the railroads where 7x9xx12 crossties are used, than on those where smaller and lighter ties are bandled.

The use of locomotive cranes, to switch and unload the materials, has proven to be very economical and successful under certain conditions. They are able to displace a locomotive in doing the shifting and are able to pile twice as much material in the same area, at less than half the cost of the manual method. The number of men required is very small in comparison with doing the work by hand. A thirty-ton crane can shift and stack, on an average, 3,500 to 4,000 ties per day, or 150,000 feet of switch timber. Including the cost of shifting the cars from the docks to the yard, the cost of stacking the ties with this method amounts to an average of \$0.08 per tie; the cost of stacking switch timber promiscuous lengths together, an average of \$0.35 per 1,000 feet.

The cost of loading treated ties from the trams for shipment with the crane amounts to an average of \$0,0045 per tie.

In all these calculations the cost of operating the crane, including operator, has been figured at \$1 per hour. This allows for interest on investment, depreciation, coal, oil, etc.

An instructive paper on "The Protection of Ties From Mechanical Destruction" was read by Howard F. Weiss of the Forest Products Laboratory, Madison, Wis. Lack of space prevents its publication in this issue, but it will appear in a future number.

The scope of work of the Yale Forest School was explained in an address by Samuel J. Record, who is a professor at Yale.

The address by J. H. Waterman, superintendent of timber preservation, for the C., B. & Q. railroad, summarized his observations during a number of years, regarding treated and untreated ties. His experience has been confined chiefly to the dry climate of the Dakotas, and southward and westward; but an interesting exception was the laying of 35,000 red oak ties, treated with zinc chloride, in 1903, between Concord and Jacksonville, Ill. There are still in the tracks 21,000 of these ties after ten years of service. The ties were laid in situations where they were subjected to excessive mechanical wear, and in most instances removals were not on account of decay but wear. Tie plates were not used. In the drier climate of South Dakota, 550 red oak ties, which had received the zinc treatment, were laid in 1900. In 1913 only eighteen had been taken out on account of decay. In Colorado a stretch of track in which pine ties, treated in the same way, were laid in 1900 had only five per cent of removals in thirteen years. The speaker strongly emphasized the point that one of the most sensible methods of conserving the forests is to give preservative treatment to all ties cut from quickly decaying species.

A paper on "Methods of Keeping Tie Records" was read by E. T. Howson, engineering editor of Railway Age Gazette.

F. J. Angier, superintendent of timber preservation for the Baltimore & Ohio railroad, addressed the meeting on the comparative value of air pumps and hydraulic pumps for injecting preservatives into wood. The speaker was inclined to give the air pump preference.

A technical discussion of the various styles of tram cars used by treating plants was contained in a paper read by J. H. Grow, engineer in wood preservation for the Allis-Chalmers Company, Milwaukee, Wis. The point most strongly insisted upon was that strength is more important than cheapness in equipment of a treat-

ing plant with cars. The paper contained a number of illustrations showing various styles of cars.

The committee on preservatives filed a lengthy report dealing with technical matters relating to materials and tests. The following named men compose the committee: E. F. Bateman, chairman; S. R. Church, E. B. Fulks, H. M. Newton, A. E. Hageboeck, G. H. Davidson, and L. C. Drefahl.

A paper on the "Future Tie Material in the United States," by Henry H. Gibson, was read. This paper appears in full elsewhere in this issue.

Chicago was selected as the place of next year's meeting. The other cities figuring in the contest were San Francisco, New York, and St. Louis.

The following were unanimously elected as officers for the ensuing year:

Più sini y. George I R y, manerger t, cating plants. Sante Le Radroad.
 Topeka, Kan.

First Vict Physipixi - Car G Clawford, manager American Crossoting Company, Louisville Ky

SCOND VICE PRESIDENT R. S. Mandy, president Crossoted Wood Block Paying Company, New Origans, La

THERE VIV. PRESIDENT (Γ B. Ridgeway, chemist. International Crossoting Company, Texarkana, Tex

STORFTMRYTREYSURER F. J. August, superintendent that or preservation, Baltimore & Ohio Railroad, Baltimore, Md.

Among the resolutions presented by Chairman Trumbull of the resolutions committee the two following are perhaps of greatest importance.

WILDIAS The Forsity Products Exposition is to be held in Chicago and New York in April and May or this year, under the auspices of the National Lumber Manufacturees' Association, this exhibition being the first and most important presentation of lumber and forest interests ever held, and of great importance in establishing closer relations between producers and consumers of timber, and in establishing the fundamental and economical principles connected with wood and its use therefore, is closely related to that wood preservation; be it

RESOLVED, That the American Wood Preservers' Association heartily indorse the plans for this exhibition and tender its active cooperation through a special committee appointed for the purpose of preparing an exhibit representing the wood preserving industry.

WHEREAS, The Interstate Commerce Commission is now giving consideration to an increase in the rates of freight charged by railroads; and

Whereas. The granting of such increase is claimed by the railroads to be necessary to enable them to make improvements in their equipment and facilities; and

Whereas, The use of treated material is one of the fundamental features of economic railroad maintenance; be it

Resolved, That the American Wood Preservers' Association favors such an increase in the rates as will enable the railroads to carry out their plans for improved service.

Other resolutions urged the technical schools to give great attention to the wood preservation industry; directed the executive committee to arrange for a bulletin to be prepared and circulated among members; gave hearty thanks to the entertainment committee for its excellent program; to nonmembers who presented papers at the meetings; to the special committee named to urge the retention of creosote on the free list during the recent tariff revision; to the mayor and people of New Orleans, engineering society, the press and others for courtesies extended.

Sometimes when a man reaches the point of thinking himself a failure he is just beginning to develop real strength and get in trim to make good.

The best thing to do with verbal qualifications in connection with an order for lumber is to put them down in writing to prevent error and misunderstanding.

The man who habitually puts on an air of mystery when trade matters are under discussion generally hasn't much else to put on and is really just bluffing his way.

If you are not happy at your work and in your present surroundings make a study to see if the trouble is with yourself before seeking some other pasture.

The time to have a definite understanding of terms of sale is when an order is placed—not after shipment is made.

The fellow that watches his own business closely enough doesn't have to watch the other fellow to get pointers for progress.

Future Tie Materials in the U.S.

Editor's Note

11. o.o.t., so on the batue supply of the faither in this country of a ad before the American Wood $P = e_{X} = X$ on their which was held at New Orlein, January 20.22, P14, or H nov H. Gibson, editor of Hynn

It is generating expedient to take a thoughtful look ahead, and this condition is low present in the crossine industry of this country. It is a distinct and a semewhat peculiar branch of the lumber business. The demand for material is great, with a constant tendency to increase, and with assurance that the demand will continue. The substitute question has not seriously entered the cross-tie business. Scores of patents for metal and other composition and combination ties have been issued, but for all practical purposes such ties may be ignored. They cut practically no figure at all in the supply in this country because they are not used. Wood is furnishing and, as far as can be foreseen, it will continue to furnish the ties.

New lines will be built, but even if demand for new tracks is ignored the call for ties for repair work will continue and it must be met. The general public may not be aware of the fact that seven crossties are used for repairs and renewals for every one that goes into new lines. Of the 126,155,000 ties bought by steam and electric roads in 1911, only 11,041,324, or 8.2 per cent, went into new construction; the others were for renewals, and the proportion used for renewals was still higher in later statistics. This is an effective answer to the argument sometimes advanced by poorly informed persons, who say that the country's railroads are now practically all built and the demand for ties will soon fall to a small percentage of what it now is.

Two things are wrong with this argument. First, the building of new lines is not at an end, nor anywhere near it; and second, it is were so, the call for ties would not greatly diminish, because tracks will have to be maintained, and the principal demand is for repair work. The fact must be accepted that enormous quantities of ties must be provided every year as far into the future as men are now privileged to look; and the question which demands a practical answer is, where are these ties to come from? Are the forests producing them as fast as they are wanted, and, if so, will the supply continue in the future or will it decline?

It is not necessary to sound a sensational alarm. The country does not want sensations; it wants facts and careful conclusions. A good many scares on account of the lumber situation have turned out to be less warranted than at first was supposed, and it is unnecessary to repeat the experience; but the situation demands attention.

In round numbers, 125,000,000 crossties are needed yearly. This is equivalent to 4,000,000,000 board feet, and the ties cost the railroads approximately \$15 per thousand feet, board measure. Practically the entire quantity is cut from nine or ten kinds of wood, chief of which are oak, pine, Douglas fir, cedar, chestnut, cypress, tamarack, hemlock and redwood. Specifications sent out by the principal railroads of the country list seventy-eight woods that will be accepted for ties; but many of these are simply subdivisions of the oaks and pine, though a number of the so-called minor species are

A casual examination of crossties statistics will suffice to show that a few woods are furnishing most of the material, although the forests of the United States contain over 500 different species of wood. It might be supposed that when the few woods which now are furnishing the bulk of the ties become scarce, the tie cutters can simply switch off to some of the 500 other kinds and go on cutting. That would be a simple solution of the problem if it were practicable, but serious obstacles are in the way of doing it. Four out of five of the forest trees of this country, taken as they come, are unfit for any kind of crossties, and must be left out of all consideration, both for the present and in the future. They are either too small or too scarce.

The kinds of wood and the number of ties bought in 1911 by steam and electric roads in this country are shown in the list which follows:

Oak	59,508,000
Southern tine	24 265 000

Douglas in	11,253,000
Western pine	2,696,000
Codar	8,015,000
Chestmit	7,542,000
Cyptoss	5,857,000
Tamarack	4,138,000
Hemlock	3,686,000
Redwood	1,820,000
Gum	. 1,283,000
Beech	1.109.000
All others	2,682,000
Total	. 135,053,000

Nearly half of the ties are oak and about half of the remainder are pine. These two woods constitute sixty-five per cent of all. The largest demand is made on oak, because it has been regarded as the best tie wood, all things considered; and the first indications of diminishing supply are seen there. The railroads can still buy all the oak ties they want if they are willing to pay the price; but the contractors are obliged to go farther to get them, to take a little lower class of trees, and to charge more for the ties. In some localities no scarcity is apparent, but when the country as a whole is considered, it is quite noticeable. In Arkansas, for instance, the supply may be somewhat ahead of demand at times, while in Pennsylvania, Ohio and New York the railroads may have trouble in procuring the oak ties they need. Some regions which formerly had more oak than they could use now have little or none. There is no question that oak in this country is being cut much faster than it is growing, and it is only a matter of time until scarcity will be everywhere felt. This is probably true of white oaks more than of red oaks, as far as ties are concerned, but it holds generally for all oaks. Most ties are cut from small trees, and this practice strikes the oak supply of the future in a vital spot; for a tree that will make three or four ties now would be good for as many saw-logs some years hence. The oak-tie cutters, therefore, while utilizing a good deal of material which would otherwise be wasted, are industrious destroyers of prospective forests. They take the trees that are coming on, and the railroads, as well as other industries, will miss these trees in years to come. If white oak ties could be had when and where needed, and at reasonable prices, railroads would use few of any other wood.

The second important crosstie source is pine. The four southern yellow pines are considered best in the pine class, and long leaf pine, being harder and more durable than the others, is at the head of its class. This is the tree commonly known as Georgia pine, hard pine and heart pine. Two other southern yellow pines are largely cut for ties, short leaf and loblolly. They are softer than long leaf pine and decay more quickly when exposed to the weather. Statisties do not show the relative numbers of ties cut from the different southern yellow pine, but all are important.

Long leaf pine grows slowly and reproduces poorly. When present forests are cut little more need be expected from that tree. The situation is much the same with short leaf pine, but not with loblolly, of which more will be said in a future paragraph.

It is thus seen that white oak and southern yellow pine, which at present are the chief sources of ties, are being depleted. The process is not so rapid as to call for immediate alarm, but the tendency is unmistakable. Much northern white cedar remains, but its growth does not half make good the cut, and any increased demand would quickly bear results in lessened supply. In other words, there is not enough of this cedar to last long if tie cutters should undertake to make good there what they will soon lose in white oak. The same holds for hemlock and tamarack. They are as important now in the tie business as they will ever be, but they may hold their own for some time.

Chestnut is a substantial tie material, but it is now passing through

a crisis on account of the blight, and no dependence for the future can be placed on it.

The situation may be summed up in a way to show that the trees which now furnish the bulk of tree, and have done so for years, can not do so much longer. Ties, however, must be had, and new sources of supply must be found. What are the possibilities along that line?

Douglas fir, western yellow pine and redwood are abundant in the tar West. They are supplying als 3 16,000,000 (ies a year now, and for years to come they could furnish all the railroads of the United States. In fact, there is enough of these three woods on the stump now to supply for 200 years all the ties wanted, provided the demand would not increase above what it is now.

Two factors stand in the way of turning Douglas fir, western yellow pine and redwood over to the railroads as a reserve source of ties. The wood is needed for other purposes, and it is so far away from the majority of the railroads that the cost of the 2,000 or 3,000 miles haul would be prohibitive. The railroads must find ties closer home, if possible, or as long as possible.

In a preceding paragraph of was shown that the average cost of ties, when bought by railroads, was about \$15 a thousand feet, board measure. It happens that the average value of sawed lumber in the mill vard is practically the same, taken for the whole country. The value quoted for the ties applies when delivered on the right-of way, which is generally near the place where they are to be used-their ultimate market. The lumber, on the other hand, is valued in the mill yard, the point of production, which averages about 300 miles from its ultimate market. The important point to hear in mind is, in making this comparison, that crossties, foot for foot, are cheaper than lumber, though the difference is small. It amounts to approximately the freight on a 300 mile shipment of lumber; that is, an operator can get a little more for his logs reduced to lumber than if he made them into ties, but the difference is not large enough to pay for sawing the ties. Otherwise tie timber would be sawed into lumber. There is a nice balance here, a sort of competition between the lumberman and the railroads for the tie lumber. The railroads have to pay enough to draw it away from the lumberman. In a former paragraph the statement was made that railroads could still procure all the white oak ties they want by raising the price. They would need to raise it only in those localities where lumbermen are now outbidding them.

This phase of the situation is somewhat modified by the fact that ties are often made of timber of such small sizes or otherwise of such inferior grade that if converted into lumber it would not be very valuable. This is really the saving grace in the situation, because if railroads were compelled to buy ties made of oak fit for quarter-sawing they could not afford to touch an oak tie.

As far as absolute scarcity of tie timber is concerned, it will be many a year before railroads are unable to get some kind of ties if they are able and willing to pay the price; but the time is not far off when the manner of providing ties for the country's railroads will need radical revision. The revision has already begun, and its basic principle does not consist so much in searching for new woods as in treating with preservatives the old woods to make them last longer. The salvation of the railroads lies in that direction. They must get along with fewer ties by making them give longer service.

The search for new woods has been thorough. It has been clearly seen that white oak cannot hold its place indefinitely, and it has been a question what shall take its place. Various suggestions have been made, and commendable efforts have been put forth to provide for the shortage when it comes. Enthusiasts have suggested that the semi-tropical hardwoods in southern Texas and Florida be utilized for crossties. The hardness of the woods and their unquestioned durability have been pointed out.

The suggestion is honestly made, but without due consideration of the fact that ties piled along the Rio Grande or on the southern coast of Florida are a long distance from the places where they are needed. But that is not the weakest point in the matter. All of the semi-tropical woods from Key Largo, Florida, to Devil's River, Texas, would hardly make enough crossties to last the railroads of this country one year. To depend on those woods to really help the situation

is a delusion and a snare. The list of alleged semi-tropical tie timbers is long enough, to be sure, and includes mangrove, lignumvitae, blackwood, strongback, buttonwood, inkwood, mesquite, huisache, cats-claw, horsebean, Texas-clony and fifty more, but a personal acquaintance with the region will speedily convince anyone that the names are about all there is of the trees. Trunks are few, small, crooked, branched and deformed, Railroads in the immediate vicinity use some of the woods for ties, but it is because they are convenient.

Some of the country's leading railroads anticipated tie shortage some years ago and undertook to plant trees and grow the necessary timber. The move was commendable and deserved better success than attended it. In the first place, not enough planting was done to make a ''drop in the bucket.'' Had all the trees done well they would not have furnished enough ties to amount to much; but there were other troubles. In the East the planted locast was eaten up by beetles; the chestnut was threatened or attacked by blight. In the South the catalpa was a fizzle; and the enealyptus plantations on the Pacific slope are still in the inchoate and experimental stage.

Meanwhile the railroads must have ties, and they will continue to buy them in large quantities. The standby timbers, such as white oak, hard pine and northern white cedar, are still holding out, but they cannot meet the demand much longer, and other kinds of timber must make up the deficiency.

The reasonable thing to do is to treat all crossties with preservatives to make them last longer. By doing that the demand can be cut down nearly one half, because a properly treated tie lasts nearly twice as long as one in its natural state. That, of course, depends on the kind of wood. Some last a long time in the wood's natural condition, and preservative will not double their period of usefulness; but others decay quickly if unprotected, and the life of such can easily be doubled.

Preservative treatment is neither new nor experimental. It has been tried and proved. In 1912 there were 112 treating plants in the United States, nearly ninety of which were well equipped. Steam railroads operate twenty-two plants for treating their own crossties and other timbers. In 1911 there were 31,141,231 crossties treated in this country, and it is interesting to note the various woods making up the total. The following table gives the information:

Southern pine	11,606,392
Oak	9,433,002
Douglas fir	3,628,706
Western pine	-1.789,026
Gum	-1.182,095
Tamarack	755,414
Beech	730,328
Birch and maple	620,047
Hemlock	535,255
Elm	292,008
Spruce	102,808
('ypress	101,864
Lodgepole pine	92,158
White pine	78,273
Hackberry	62,568
Chestnut	47,538
Sycamore	32,244
Cedar	26,000
Hickory	21,441
Walnut .:	2,000
Ash	
Cherry	674

The tendency is apparent in the above table. The treatment is being applied to woods which decay quickly without it, thereby drawing upon new sources of supply. The reports do not specify, yet it is well known that most of the nine million and more oak ties which passed through the treating plants were in the red oak or black oak class. These woods in the natural state decay quickly when laid in tracks; but treatment lengthens their life. Nine million red oak ties lessens the drain by that much on the white oaks. Even such woods as gum, beech, elm, white pine, sycamore and hickory make good ties after being passed through the preserving tanks. A practically worthless tie wood in its natural condition is converted into a serviceable piece of timber by the injection of preservatives.

In that direction lies the hope of the situation. Ties can be made

the second of the second as warrely worth cutting for that segment 19 to a second tree that grows in this country, at large construction of the above 19 very soft, like buckeye, aspect of a ratio for each second order the right to prevent rapid week.

As a constant lead to easily a substant of particularly discounting a series, but dozent against some of others heretofore landly used are available with the aid of the treating tank. A practically clean sweep can be made of all trees on a tract, provided they are of suitable size. That will bring ties to the traces when haretofore were left as an enumbrance on cut over land. Utilization will be closer, waste will be iess. It will not be a question of finding new sources of the material, but of making better use of well known sources. It costs more to treat a tie than to use it untreated, and for that reason woods which naturally last well will continue to be sought; but when they can no longer be found, or cannot be procured except at a price exceeding that of cheaper woods will come in.

The time will doubtless arrive in the United States, as it has already come in France and Germany, when ties will be cut from planted timber; but that time is a good while in the future. A little

planting has been done, and is being done, but for many years the railroads must look to natural woodlands for ties. Nature is still able to plant trees in this country a good deal faster and more cheaply than man can do it, but nature needs man's help in caring for them after they are planted.

Some of the species which hold out promise as sources of ties because they grow rapidly, reproduce readily, take preservative treatment easily and have extensive ranges, are lobbilly pine in the South and white pine in the North; willow oak in the South and red oak in the North; and the cottonwoods and willow in the South and Middle West. These are not the only ones, but they are important, Rapid growth and good trunk form are essential. Lobbilly pine in particular is remarkably promising because of its wide range, vigorous growth, dense stands, phenomenal reproduction and the value of the wood. Willow oak on fertile southern land grows nearly as fast as lobbilly. It is in the red oak class. Black willow on good land grows as fast as either.

In the far West the tie problem is not serious. The pines and firs already of tie size are sufficient for all needs for many years; but, none the less, preservative treatment is as essential there as in the East; and it may be safely predicted that before many years few untreated ties will be laid anywhere in this country.

The Ebony Forests of West Africa

The ebony is one of the most widely diffused and at the same time one of the rarest woods in the tropical and sub-tropical parts of the world. It is true that a few species of which our American persimmon (Diospyros virginiana) is the best known, occur in the temperate zone, but as a rule ebony is a tropical product. Enormous quantities of this valuable wood come from Ceylon, India, and other parts of the East Indies, but it is now becoming rare. During the last twenty-five years ebony has been exploited more or less extensively in parts of equatorial Africa. Several different kinds of woods not belonging to the ebony family are now being brought from Africa into the European markets, but this is because the region where true ebony abounds has not yet been opened up.

The true ebony tree, which the natives call evila (Diospyros cbenum), occurs abundantly in French Congo. It is found also in Cameroon, where it has been exploited more extensively than in French Congo. Early travelers who visited points on the west coast of Africa found cbony in great profusion, and it is said to be particularly plentiful in the Province of Gaboon of French equatorial Africa. It does not grow on low ground near the coast, but occurs farther inland all along the ridges and hills which in Gaboon run north and south. Central Gaboon, where this species attains its best development, is the territory lying between Libreville, which is the principal scaport town of French equatorial Africa, and Franceville, an inland town on one of the tributaries of the Congo river. This region is very hilly and is cut up by numerous small rivers, some of which flow north into the Ogoue and a good many flow south into the Congo river.

Gaboon lies within the belt of virgin tropical hardwood forests, having an average annual rainfall of about seventy inches. The forests here are exceedingly dense, forming impenetrable jungles along the streams and rivers. The ebony is found intermixed with a great many other forest trees, many of which may be classed among the precious woods. It is found in greater abundance at the tops of the hills and becomes gradually less plentiful as one approaches the streams in the valleys below. The natives have not yet exploited much of this wood, but they know its value as an article of export. Cam wood (Baphia nitida) is very plentiful along the water courses throughout this tropical evergreen belt of vegetation. This is the wood imported into Europe and America for dyeing or coloring.

The ebony is one of the finest and most graceful trees of the African forests. Its leaves are long, sharp-pointed, dark green, and

hang in clusters producing a very dense shade. Its bark is smooth and dark green. The trunk rises straight and clean of branches to a considerable height, often from fifty to sixty feet. Specinens may frequently be seen which have a diameter of five feet at the base. The mature ebony tree is always found hollow, and even its branches are not always sound. The sapwood is white and in an average tree it is from three to four inches thick. The heartwood, which forms the ebony of commerce, is jet black. The young trees are white or sappy to the center, and even where they attain a diameter of nearly two feet the heartwood is streaked with white. Trees less than three feet in diameter are not cut down.

Generally three or four trees stand together, and none others within a little distance. Ebony gatherers will have very little trouble in finding suitable trees to cut, but they experience the gravest difficulties in getting the lumber to a place of shipment. The logs cannot be floated, because even the thoroughly dried wood is heavier than water. The only local use for ebony, which is very limited, is for making the rudely shaped divinities, several of which may be found in every native village.

Lumber Outlook in China

In the upbuilding of China there is a good field for American lumber, and a demand will soon be felt for railroad tie material. Although Japan holds a good place in the tie market on account of her proximity to north China, in her own native chestnut and oak, yet there is room for outsiders, especially in creosoted ties. Creosoted Oregon pine is already coming into the Chinese market at \$1.15 a tie. South China will require the more durable and lasting creosoted tie on account of its wet climate. For general building lumber the ordinary Chinese houses are now using native wood to a great extent. However, near ports and harbors a quickening demand is beginning to be felt for interior finish and flooring.

The lumber tariff on imports into China has been about seventy cents a thousand board feet in tie material. The costs for unloading ships, etc., include a river due of one-fifth of one per cent; lighter charges \$1.80 per 300,000 board feet; stevedoring, about forty-two cents a thousand. On the average it costs about \$2.85 a thousand feet to get lumber into the yard. Town deliveries vary in cost from thirty to seventy cents a thousand, and loading railway cars, about twenty cents a thousand. Such, in brief, are the figures from China as sent in by a lumber merchant at Hongkong.

Sawing Defects and their Causes

Occasionally a wholesale dealer in lamber will find himself in a bad fix with a lot of lumber or band, perhaps on ears awaiting his order, having been refused because, as a result of poor sawing, it ran uneven in thickness. This condition is not uncommon in the yellow pine industry but seems to be more prevalent in hardwood sawnilling than in any other branch of lumbering. It is one of the reasons why many wholesalers in hardwood hesitate and even refuse to buy stock from the smaller mills, and it is one of the things that handicaps the small millman when he goes out to sell his stock gither to a wholesaler or to a consumer.

The writer has in mind a specific instance illustrative of this feature and the attitude experienced millmen and dealers take toward it. The case is that of a well-known hardwood millman who saws quite a lot of lumber himself and buys quite a lot from other mills to help supply his trade. Frequently owners of small mills come to him offering their product. He experimented with this stock until he found it so difficult to handle because of poor manufacture that he lost his inclination to turn a friendly eye to a proposition of this kind.

By and by, because of the insistence of so many of the smaller millmen, the large operator conceived the idea of instructing and supervising them in their work in the hope that some might be encouraged to improve their product. The particular case in mind here was a small millman who was so insistent on making a deal that the lumberman in question made a tentative agreement with him on condition that he would jut his mill in proper order and do his sawing as it should be done. The millman readily agreed to all this and was very thorough in his promises to make his lumber right, and on this basis he went back home and started to work getting out lumber. By and by the lumberman went down to see what he was doing but no sooner did he observe the plant and its equipment, and the work it was doing, than he called the whole deal off. In talking of the matter afterward he said that the small millman simply had never gotten into his head a true conception of what it takes in the way of equipment and what it means in the way of perfection to do good sawing.

It is impossible to say just how much lumber is lowered in value by poor sawing at hardwood mills. It is easily evident that if it could be totaled and the deficits rightly measured it would present some startling figures. Moreover if the figures were presented it is probable that there are many millmen who would argue that a certain percentage of poor sawing is unavoidable and there is no use in trying to attain perfection in this work.

Yet we do get evidence now and then that notwithstanding many mills are woefully careless and many thousands of dollars are lost to the sawmilling fraternity because of poor manufacture lowering the value of their stock, it is not only practical to do almost uniformly perfect sawing but it is not difficult to find examples of where it is being done. The writer recently spent some days observing the work of a good mill with this very point in view. It was a well equipped mill but not extraordinarily so. It consisted of one log band saw and two band resaws, one for ripping flitches into boards and the other for resawing boards. The mill was kept under observation not just one day but in a general way for nearly a week, and during all that time it was hardly possible to find an instance of a board spoiled or lowered in grade because of poor sawing. The band saw in the mill was made to stand up to its work and the minute it showed signs of not doing so it came off the wheels and a freshly filed one took its place. There was nothing extraordinary in either the filing room equipment or the filer's ability. It was just an average example of modern, well handled sawmilling in which the percentage of poorly manufactured lumber was so low as to be practically a negligible item.

A certain yellow pine millman once made the statement that if he got as much as a carload of missawed lumber in 12,000,000 feet of stock somebody would get a jacking up. This was said to illustrate the degree of perection that is attained in the work of

sawing in some of the pine mills. Pretty nearly the same degree of perfection can be obtained in a hardwood mill. It may call for changing saws oftener than in sawing pine but there is nothing impractical or extremely difficult about it in this day of science and outomatic appliances in the filing room, and its accomplishment is possible.

It is contended by some that the greatest percentage of miscuts in sawing lumber is due to crowding, to efforts to secure quantities extended to the point where they sacrifice quality. This fault, however, is more likely to be found in the pine mills than in the hardwood. The hardwood men realize that they must handle their work more carefully than the pine men to get the best lumber in the best shape from their logs, consequently there is not generally the same element of crowding in the hardwood mill that is found among the pine mills. Perhaps there are some mills where they put so much stress on the quantity that they sacrifice quality, but that is not the rule especially in these days when the quantity element is helped along by the use of resaws to relieve the mill saw of part of its work.

What is usually assigned as the next important cause of miscut lumber is poor work in the filing room, which may be due to either ignorance or neglect. Sometimes when a new filer comes on to the job even though he has had experience and takes pains with his work he will have some trouble for a while. However there are competent filers to be had and millmen as a rule pay enough for this filing service that they may well insist that their saws stand up and do their work. It is the duty of every mill manager to watch this point in his mill carefully for sometimes even if the filer is competent he becomes careless and negligent and things of this kind should not be tolerated in this day, because both the timber and the time of the millmen are too valuable to be wasted at poor sawing. Sharp saws should be insisted upon rather than so many saws or so many changes a day. A dull saw not only pulls heavy but it runs uncertainly and is likely to go bad and spoil lumber any minute. The sawyer should watch his saw carefully and when it shows dull, pull it off immediately regardless of how long it has been running, and see that it is put in perfect cutting

Poor head blocks and poorly and improperly installed machinery may cause defects in sawing. There is very little excuse for this condition because any man competent to erect and operate or manage a sawmill has sense enough to know when his machinery equipment is faulty either in itself or in its installation. That means that it is either negligence, carelessness or something of the kind that permits the use of machinery not in proper condition. There is very little excuse for the man who permits things of this kind to continue very long.

Another preventable and inexcusable source of defects may be found at the edger. Here again we have a matter of carelessness rather than of ignorance. Carelessness makes a dozen bad boards where ignorance or necessity makes one, and it is carelessness that causes fully ninety per cent of the irregularities and defects in the edging and trimming of lumber. Carelessness of this kind is unnecessary and inexcusable. It is the duty of the sawmill foreman to prevent just such things as these. The manager or the owner should see that his mill foreman does his duty in this respect.

Miscuts in sawing and lumber spoiled or lowered in grade through defective manufacture is, after all, quite largely a matter of habit. It is a habit of neglect and carelessness that somehow fastened on to the system of millmen and operators in the old rough and tumble days when timber sawing and precision in sawing were not considered factors of great importance. We need some swearing off from these old habits and a campaign of reform in the sawmilling industry that will cry out for precision in this work until it not only makes itself heard but until the cry is duly heeded by the majority of sawmill operators without regard as to their size.

Names of Woods Hard to Change

It is much casier to range a tree than to change the name after at has been accepted by persons well acquainted with it. One of the best examples of this is vellow poplar. Botanists have tried long and hard to prevail on lumbermen to call this "tullip-tree," That is a good, descriptive name, from the hotanists' standpoint. It is the only tree in this country that bears a flower which resembles a tullip, and for that reason the name would define the tree without any probability of confusion. The United States Forest Service threw the great weight of its influence on the side of the botanists fifteen years ago. When Sudworth's Check List was published in 1898, it sanctioned the use of the name tulip-tree as official.

The change of name never became popular with lumbermen and users of wood. They refused to call it by the new name. In fact, few lumbermen to this day understand what tree is meant when the name is used. The term yellow popular is so firmly fixed that change to anything else is improbable. In some regions, however, it is called whitewood. This is particularly true in New England. The same name, however, is often applied to basswood in the same regions, and confusion is quite probable; but yellow popular means one tree and no other.

Trees which lumbermen name are nearly always named because of some prominent characteristic of the wood. Names bestowed by botanists usually describe some feature of the leaf, fruit, flower, or bark. The wood is the only thing with which the user is concerned. It matters little to him what its shape or size of the leaf or flower may be. On the other hand, the botanist seldom looks at the wood, but gives all of his attention to foliage and other external features.

If these facts are borne in mind, many of the double or numerous names of the same tree can be accounted for. For example, Sudworth's Check List, already referred to, contains approximately 500 trees which grow in the United States, and these trees have 2,414 English names, besides several names in Latin without any English equivalents. This amounts to about five names for every tree, on an average. If a person will go over these names, one by one, he can usually pick out the names bestowed by users and those given by botanists. For example, white pine is a lumberman's name, but white bark pine is a botanist's; net leaf oak is a name devised by a botanist, but post oak is a woodsman's term; lanceleaf alder is plainly a name bestowed by a man who was looking at the foliage, but red alder's name was given by users of the wood.

As a general thing, trees which are of small commercial use carry names given by botanists; but those of importance in lumber transactions bear woodsmen's names. Attempts to change names in common use are not usually successful. The failure of the effort to induce users to call yellow poplar by the name tulip-tree is an example. Another that has been equally unsuccessful is seen in the case of soft maple. Botanists want that tree called silver maple on account of the color of the leaves and bark. Nurserymen have made the change. When they sell soft maples for shade trees in yards and along streets, they sell "silver maple"; but when a lumberman buys or cuts the same tree growing wild, he calls it "soft maple." The name silver maple is probably never found written on the records of a sawmill or other wood-working factory. From the standpoint of exact definitions, the botanist's name is preferable, because there are several species and varieties of soft maples, all considered as one by lumbermen, but botanists insist on a separate name for each.

Rock elm is another case to the point. There is no question that more than one elm sometimes passes by that name in lumber yards, but the tree commonly considered as rock elm is the *Ulmus race-mosa* of the botanists, which is most abundant in Michigan and Wisconsin. Botanists insist that the tree should be called cork elm, and it is so named in Sudworth's list of trees. That name naturally suggests itself to one who examines the living tree,

because the lumps of bark on the limbs are easily seen and suggest knobs of cork; but the lumberman who handles logs or lumber sees no cork, and the name means nothing to him.

The hardness of the wood, however, does mean something to the man who uses it, and in recognition of its hardness he calls it rock elm. Attempts by non-users to have the name changed to cork elm have met with no success. The name is practically unknown among the users of the wood.

A similar situation exists in the case of "rock oak." Botanists do not recognize that as the proper name of any tree, yet at least three oaks are occasionally so called by lumbermen. That to which the name is usually applied is the Quereus prinus of botanists (chestnut oak). Its leaves resemble those of the chestnut, hence the name; but the user of the wood cares nothing about the leaves. Hardness and strength are what appeal to him, and he prefers to call the wood rock oak, occasionally designating it "iron oak," by which term he translates his idea into words.

Tupelo is another instance of lack of success attending the efforts of botanists to change the name of a tree to which lumbermen had already given a name. If one observes the crown of a tupelo tree in spring when leaves are young, the whole top looks as if it were sprinkled with cotton. It is the hairs on the young leaves. It is a conspicuous feature and one which might reasonably be considered in naming the tree. It would be supposed that the botanist who gave the species its technical name (Nyssa aquatica) would have recognized that conspicuous feature, but he did not, for some reason. The Latin name which he bestowed on this, the largest and least graceful of the gums, might be liberally translated "water nymph." What suggested such an incongruous name is not now known.

Users of the wood, from the days when its chief place was as "back-logs" in southern cabins, called it tupelo, a name bestowed by some forgotten, untutored, wild Indian "botanist" who had his eye on the fruit. The name, when once adopted, stuck to the tree, and it is popularly called tupelo to this day.

Modern botanists recognized that the original name giver had missed an opportunity when he forgot about the cotton on the leaves; and they appealed to lumbermen to correct the oversight as far as possible, by changing the commercial name from tupelo to cotton gum.

Lumbermen have not acted on the suggestion. Statistical reports compiled by mills and factories seldom use the term cotton gum, and there is no reason to suppose that they will do so. Tupelo seems to be a fixture in lumber nomenclature.

Back to Old Days

A clipping from the Boston Post regarding the construction of the "Drfiance," a yacht to be built at Bath, Me., for a syndicate of New York, Philadelphia and Boston yachtmen as a candidate for the defense of the America's cup, has the above caption, the meaning being that instead of using a finish of bronze plates the designers of this vessel will utilize a thin skin of mahogany to cover the hull of the vessel, inasmuch as it is deemed that a smoother finish can be obtained and there will be less likelihood of buckling from the rivets.

While the news item suggests that this idea is logical and that polished mahogany ought to prove less resistant to the water than any sort of metal and to be less affected by salt water, the most pertinent part of the item is the statement that "whatever the results may be in its use, the sentimental value of a partial return of the old days of wooden construction is considerable." This simply illustrates the fact that granting that two types of construction are similar, there is a real apparent public sentiment in favor of wood which has stood the tests for centuries, and which is capable of standing almost any test for centuries to come in face of all opposition.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department. HARD-WOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 643-Agrees That Old Hickory Legend Is False

The writer of the following letter read in the issue of HARD-WOOD RECORD, December 25, in the article entitled "Some Falla cies of the Forest," the refutation of the old legend regarding the cutting of hickory when the sap is down. He writes as

Aurora, Ind., Jan. 10 Editor Hyanwoon Ricoanvery much interested, and I believe greatly to our advantage, in the articles entitled "Some Fallacies of the Forest," All users of hickory timber have been taught to caution every man who cuts hickory that he must do so when the sap is down, from August to January, and that timber cut at any other time proves worthless. While many users of hickory could not always lay in supplies sufficient to last a year and have used lots of hickory cut when the sap was up, they found that with proper care they got as good results as when cut at the so-called "proper time."

This article will prove a great comfort to all of us who are glad to get hickory cut at almost any time of the year.

B 644-Wants Hickory Squares

Detroit, Mich., January 16. Editor Hardwood Record: a continuous supply of hickory squares of various sizes and lengths.

Must be forest hickory. We will be obliged to you for any information as to who can supply this stock.

This correspondent has been given a list of manufacturers of hickory squares. Anyone desiring to communicate with this prospective purchaser can have the address on application .- Edito:

B 645-Hardwood Man Writes Regarding National Rules

-, January 19.-Editor Hardwood Record: I read your article in the December 25 issue of Hardwood Record under the heading "Kicking About Grading Rules" with interest and I thought it a plain, clear and honest statement of conditions. It was the consensus of opinion of the hardwood manufacturers that the slight changes in the rules made last June at the annual convention did not lower the grades of lumber but rather balanced them up and made them more concise and more easily interpreted. In a personal way I am glad to say that no consumer to whom I am shipping has refused to accept present rules or has even commented in any manner whatsoever as to the slight changes made last June. The demand for National inspection is more popular than ever and National inspectors are all busy. This is true notwithstanding the fact that the last few months of 1913 were very dull.

The buyer has a perfect right to buy on any rule the seller will sell on, but of course the National association can inspect only on the rules in

B 646-Wants Cull Box Pine

Dolgeville, N. Y., January 20, 1914. -Editor Hardwood Record: We are wondering where a large number of box makers secure a grade of cull box pine for making packing cases. We are in the market for a large quantity of this stock if it can be purchased at a reasonable price and we wish that if you know the names of several parties who will be able to supply this, you would advise us.

This concern has been given the names of a few people that could possibly get out this particular stock. Others interested can have the information on application .- EDITOR.

B 647-Wants 7/8" x21/4" Face Maple Flooring

Greensburg, Ind., January 17. Editor Hardwood Record: A very good personal friend of mine who is in the contracting business writes me that he is in the market for 50,000 feet of No. 1 maple flooring 3/4"x21/4" face for delivery at Pontiac, Mich., where he is completing one of his contracts. Would you be kind enough to give me a list of maple flooring manufacturers who could supply him with this stock and who in your judgment would be apt to quote him prices that would be in line?

This concern has been given the names of a few manufacturers in that region. Others interested can have the address on application to this office.-EDITOR.

Clubs and Associations

Board of Managers N. H. L. A. Meets

The solution is 1 is cline of the loaded of maning is of the Noteins, arthogod Limit - A on their was field at the executive office 1864. Distributed Limit McCormick Building, Chicago, January 13, 1914, with the following attendance: Chas H. Barnaby, president, Orson E. Yeager, vice-president, J. V. Stimson, vice president; E. V. Bubcock, vice-president; Frank F. 13th sections treasure (Lorentze I Jones, 17ed W. Mowbeay David Wolf, M. J. Quinlan, W. J. Hetherington, Earl Palmer, Oliver O. Agler, F. A. Diggins, C. A. Goodman, F. S. Underhill, W. W. Knight, B. C. Currie, Jr., T. M. Brown, Chas. B. Dudley, G. N. Breece, J. W. Dickson.

Report on membership since the convention of June 7, 1913, showed seventy-three new applications received. Of this number lifty-five had been passed upon and admitted to membership at executive committee meetings and the remaining eighteen were elected to membership.

Secretary Fish reported after making deductions of concerns who had retired from business and been lost from all causes, that the net gain was considerably in excess of that of any recent year and that the present membership in good standing is 883 firms.

Invitations to hold the seventeenth annual meeting were presented from New Orleans, Philadelphia, Buffalo and Chicago, and the board voted unanimously to hold the next annual convention in Buffalo, N. Y., on the invitation of the lumbermen of Buffalo, and the dates selected were June 18 and 19, 1914.

Stave Men to Meet in Chicago

Chicago was chosen as the next meeting place of the Tight Stave Manutacturers' Association, which ended its annual convention at Memphis, Tenn., January 21. George Walbert, Batesville, Ark., was elected presideut and E. H. Defebaugh, Chicago, re-elected secretary

Forestry Association Meeting

The American Forestry Association met in Washington, D. C., on January 14, in its thirty-third annual meeting. This is a voluntary public service organization, asserted that forestry means the propagation and care of forests for the production of timber as a crop, the protection of watersheds, the utilization of non-agricultural soil, and the use of the forests for public recreation, and urged that federal and state governments undertake scientific forestry upon forest reserves for the benefit of the public. The association pledges itself to support federal administration and management of national forests; federal co-operation with states, especially in forest fire protection; acquirement and development of forest lands by the states; the encouragement of forest planting by federal, state and private owners; close utilization in logging and manufacturing, without loss to the owner; cutting of mature timber as the domestic market demands it and equal protection to the lumber industry and to public interests in legislation affecting private timberland operations.

After transacting a large amount of business, one item of which was embraced in a resolution to hold the 1915 meeting in San Francisco, the following officers were elected:

EXECUTIVE SECULTARY—P. S. Ridsdale, Washington, D. C.

Philadelphia Wholesalers' Hold Annual

The Philadelphia Wholesale Lumber Dealers' Association held its twentieth annual meeting and banquet on January 8, in the Union League building, Owen M. Bruner, of the Owen M. Bruner Company, president, in the chair. The walls and tables were elaborately decorated, and a select orchestra furnished delectable music at intervals throughout the

President Bruner's speech follows in part:

This evening, which marks the conclusion of the present administration, terminates a happy, harmonious and strenuous year. It has been a true pleasure for me to have had the honor of being your president, and I owe a deep debt of gratitude for the faithful and loyal support of the vice-president, board of directors, and standing com-

a devoted their trac and mergic

hart with the state of the free and near to the state of the state of

of our meetings.

We believe that It seems to me that our organization should work with all lumber men grant the encrowlinear of wood substitutes. We believe that cene ut a 18 its place or its use for sidewalks and pavements, but we had, the cene ut and other substitutes should not supplant wood where wood is the est naterial to be used. In the construction of the recent Artiento (i.t. pure, in which the specimetons called for cene in the recent is and I went togethe? to the architect and prevailed upon him to use more than 100 nour test of he architect and prevailed upon him the second there would have diminated the use of other lumber in the further construction of the plet of the properties of the construction of the other construction of the other construction of the plet of the properties of the occan waves.

This twentyth ammerisary of coment crunided before the occan waves.

This twentyth ammerisary of our organization, I think, should be celebrated as an expression's night, with the pleasure and honor of having in the chair one of our most loyal and substantial members and at expression.

Robert I. Lippincott gave a talk, which was a salient feature of the evening's entertainment. He dwelt upon the progress of the organization. its achievements in behalf of the business man and its glowing prospective for still further good to all who should join in its membership.

Speeches were made by E. F. Perry, New York, secretary National Wholesale Lumber Dealers' Association; John W. Long, New York, and Edwin H. Coane, an old time lumberman now retired from the business and associated with the Pennsylvania Lumbermen's Mutual Fire Insurance Company. Mr. Coane, to the amusement of all present, also sang "Jersey Sam," in his own inimitable style.

After the transaction of routine business the election of officers resulted as follows: Ralph Souder, of Hallowell & Souder, last year's vicepresident, elected president; William T. Betts. of Charles M. Betts & Co., was made vice-president, and J. Randall Williams, Jr., of J. Randall Williams & Co., secretary and treasurer. Among the directorate J. Elmer Troth and Wil liam Betts were re-elected. Augustus J. Cadwallader was elected for three years to succeed Owen M. Bruner.

Regarding the National Wholesalers' Meeting.

E. F. Perry, secretary of the National Wholesale Lumber Dealers' Association, has just returned from Buffalo, where he conferred with M. M. Wall and M. E. Preisch, trustees of that association, regarding the coming meeting of

the organization on Wednesday and Thursday, March 4 and 5 at Buffalo. These gentlemen went into the details of arrangements and the hotel facilities. It was decided that the Iroquois hotel offers excellent equipment for the meeting and banquet.

The committee has in mind several prominent speakers who are expected to be present at the banquet, and the entertainment features. both through the association and the Buffalo Lumber Exchange, will be very pleasant. There will be several matters which will be open for discussion on the floor of the convention, and the meeting promises to be a very important and interesting one.

The Buffalo Lumber Exchange has appointed a special entertainment committee to provide and arrange for the comfort, entertainment and hospitality of the visitors. That committee consists of M. M. Wall, chairman, John McLeod, Orson E. Yeager, C. Walter Betts, M. S. Burns. Hugh McLean and Henry I. George.

National Lumber Exporters Meet

The regular annual meeting of the National Lumber Exporters' Association was held January 22 and 23 in the Rose room at Hotel Sherman, Chicago, with President Fred Arn of Chattanooga. Tenn., in the chair, and J. McD. Price of Baltimore, Md., secretary.

The business of the past year and prospects for the future were discussed; but as all the sessions were executive, and the proceedings were not made public, exact statistics of the past year's business are not available. It is known, however, that the exports of lumber are increasing, as is shown by data for eleven months of 1913 compared with the corresponding period from 1912, the month of December being omitted from both. These henry are given in the following table:

		First 11 Months
	of 1912	of 1913
Theworld timber	. 8 T24,236	8 867.781
Sawed timber	. 10.016.503	8.915.773
Liam er		0,020,110
Cypress	168 031	442.285
1.0	7,178,869	8,402,156
	1.960.074	2,570,330
	10.342,391	11,483,740
White Life	. 440,599	1,472,988
Longleat pine	14,914,163	19,837,709
Shortleat pub	914.165	813,339
All other pine	5,680,883	4.074.228
Foplar	1.233.461	1.458.006
Redwood		1.309.129
Sprace		585,194
All other lumber	6.904.633	6,672,221
Joist and scantling		323.022
Railroad ties		
		2,698,642
Round logs	3,531,094	3,717,393
and the second s	 	

The total for the first eleven months of 1913 was \$75,643,936, compared with 867,148,727 for the corresponding period of 1913. The difference in exports was 88,495,709, in favor of 1913.

All officers were reflected except two directors whose terms expired by limitation provided in the by-laws. The election of officers resulted as follows :

PRESIDENT Fred Arn, Chattanooga, Tenn.

FIRST VICE-PRESIDENT-Frank F. Fee. Dermott Ark.

SECOND VICE-PRESIDENT Chester F. Korn, Cincinnati, Ohio,

TREASURER -- John L. Alcock, Baltimore, Md.

Secretary-J. McD. Price, Baltimore, Md. FOREIGN REPRESENTATIVE -- Frank Tiffany, Leamington, Eng.

CHAIRMAN TRANSPORTATION COMMITTEE -Frank F. Fee.

CHAIRMAN ARRITEATION AND COMPLAINTS COM-MITTEE-Chester F. Korn.

CHAIRMAN MEMBERSHIP COMMITTEE-W. J. Eckman, Cincinnati, Ohio.

DIRECTORS-R. J. Darnell, Memphis, Tenn .: C. 1. Milliard, Norfolk, Va. : W. H. Russe, Memphis, Tenn.; Harvey M. Dickson, Norfolk, Va.: F. E. Hoffman, Fort Wayne, Ind.: J. W. Mc-Clure, Memphis, Tenn.; Edward Barber, Cincinnati, Ohio: George M. Spiegle, Philadelphia, Pa.; G. A. Farber, London, Eng.; W. M. Ritter, Columbus, O.; Frank Purcell, Kansas City, Mo.; Ferd. Brenner, Alexander, La.

Time and place for holding the next meeting were not fixed.

Important Meeting Southern Hardwood Traffic Bureau

The Southern Hardwood Traffic Bureau has, through the filing of a suit before the Interstate Commerce Commission at Washington against a number of roads in the Southwest, taken the first step in the direction of securing a lower rate on hardwood lumber shipments to Galveston and, incidentally, of obtaining more satisfactory rates on export shipments via New Orleans. The petition, filed through J. R. Walker, special attorney of the bureau at Washington. sets forth that there is unjust discrimination

against Memphis, which is charged twenty-six cents on shipments to Galveston, as against sixteen cents for Cincinnati and seventeen for Chicago. The commission has been asked to pass on this phase of the matter and to grant a rate of twelve cents from Memphis. The real object of the petition, however, is to secure entrance into Galveston so that exporters here may have another port through which to send their lumber shipments abroad. The rate to New Orleans is twelve cents, and a similar rate is sought to the Texas port. New Orleans steamship companies have been acting very arbitrarily in the matter of rates, and the entrance into Galveston is sought so that there may be another port with equal facilities open to lumber exporters. Mobile is the only other port that can be reached on advantageous terms now, and the use of this is largely barred on account of the lack of adequate facilities. Plans for removing the restrictions at New Orleans have been under way for some time, and the filing of the petition in question is expected to furnish the solution of what has been a rather trying situation for exporters at this point. If this move fails to bring relief there are still other methods under consideration. The bureau believes that it is right in its contentions and that the time has come when the shippers here who export lumber are entitled to more consideration than they have been receiving at the hands of the steamship companies. The Galveston rate will give the former an entering wedge and the situation promises developments that may in the end prove quite interesting.

FRED ARN, CHATTANOOGA, TENN., PRESI-DENT NATIONAL LUMBER EXPORT-ERS' ASSOCIATION

The bureau has likewise taken additional steps toward forcing the Louisville & Nashville to grant more taverable transit arrangements than are now in effect. The other carriers here some time ago consented to the arrangement by which one kind of logs could be shipped in and another kind of lumber shipped out and the refund on the logs claimed without regard to the character of the outbound traffic. This has proven of very great advantage to local lumber interests because it has prevented a great deal of money from being tled up in the shape of refunds on log shipments held back. Efforts have been made to perfect similar arrangements with the Louisville & Nashville, but these have failed, with the result that the secretary-manager, Mr. Townshend, has been instructed to place the matter before the Interstate Commerce Commission. officials of the bureau were quite enthusiastic during the recent annual of that body over the accomplishments of the past year including this better transit arrangement with the principal lines entering this city, and they are anxious to make it "unanimous."

This was the first meeting held since the recent annual, and in addition to the transaction of the foregoing the board of managers re-elected john W. McClure of the Belgrade Lumber Company as treasurer and J. H. Townshend as secretary-manager. The board also filled the vacancy caused some time ago by the death of John Dwyer, traffic manager of the Lamb-Fish Lumber Company, by the election of W. B. Burke, general manager of the same company, as one of the directors of that organization.

It was found that the constitution and by-haw needed some amendment, and a committee of three, composed of C. D. Hendrickson, Frank May and W. A. Ransom, was appointed by Chairman Burgess to make recommendations as to the changes desired. These proposed amendments will be voted on at the expiration of sixty days. The bureau was organized little more than a year ago, but it has widened its scope so rapidly that it has outgrown the by-laws that were adopted in the beginning as tentative.

Three new members were elected at this meeting: J. W. Wheeler & Co., Memphis and Madison, Ark.; The Mark H. Brown Lumber Company, Mounds, Ark., and the Memphis Band Mill Company, Memphis. There is an active campaign under way for new members, with the goal set at one hundred firms. There are more than sixty at present identified with the bureau and it is proving so useful to all concerned that it is anticipated that little difficulty will be encountered in reaching the desired mark.

St. Louis Lumbermen's Exchange Elects Officers

The officers elected at a recent meeting of the St. Louis Lumberments Exchange, held in that city, resulted as follows: F. H. Smith was reelected president and H. A. Boeckeler vice-president. The directors elected were: E. H. Luebrman, T. E. Youngblood, W. W. Milne, Charles E. Thomas, W. P. Anderson, Thomas E. Powe, and Franz Waldstein.

The secretary will be chosen at the first meeting of the directors, and it is expected that George McBlair will be re-elected.

Memphis Club Gives Banquet

One of the most notable gatherings in Memphis in a long while was on the occasion of the recent prosperity banquet given by the Business Men's Club of Memphis to its members and to invited guests from all parts of the country, including high officials of railroads, bankers, business and professional men. Covers were laid for more than 400 in the new Hotel Chisca. General Luke E. Wright, former Secretary of War under the Taft regime, acted as toastmaster, and the list of speakers included many notables. J. D. Allen, Jr., president of the Lumbermen's Club of Memphis, delivered the address of welcome on behalf of the Business Men's Club with which the Lumbermen's Club is closely affiliated and in which there is a large percentage of lumbermen. Memphis has enjoyed the greatest prosperity in its history and the banquet was primarily for the purpose of celebrating this fact. There was an even deeper significance in the occasion, however, because it was shown through the addresses of the evening that Memphis, because of its location as the centre of a section which is wonderfully rich in natural resources and because of the rapid strides made in both industrial and commercial lines, was entitled to one of the regional banks authorized by the newly enacted currency law. The Business Men's Club has been doing everything in its power to press the claims of Memphis and nothing that has been done has made so great an impression as the prosperity banquet which has passed into history as one of the most notable achievements, from an entertainment standpoint, of a city which is remarkable for its performances along this line. All of the after dinner speeches are being arranged in pamphlet form and it is expected that much good will be accomplished in the direction of boosting this city as the future home of one of these regional institutions. The lumbermen have been backing the Business Men's Club and they are heart and soul with that body in the movement which it has launched under such favorable auspices and in such a happy way.

The National Chamber of Commerce

The state of Illinois should be proud of its record as advocating and supporting the advanced business and industrial ideas as evidenced by the membership of Illinois commercial organizations, which have joined the Chamber of Commerce of the United States of America.

A news bulletin recently issued by that organization says that there are now fifty-six commercial organizations in Illinois represented in the National chamber.

. . .

There is a total of 488 organizations, constituting the membership of the National Chamber of Commerce—Every state and territory is represented with the exception of New Mexico, while commercial organizations in Hawari, Porto Rico and the Philippine Islands have been elected. The American Chamber of Commerce in Parts, and the American Chamber of Commerce for the Legant are also members.

The second annual meeting will be held in Washington, February 11-13, and several hundred business men, representatives of the different associated organizations, are expected. February 12 will be devoted to the proposed consideration of all that is involved in the Sherman antitrust law and the regulations of corporate activity by law.

On February 11 Secretary Wilson of the Department of Labor will address the meeting on "The Relation of the Department of Labor to Industries and Communications."

Forest Products Exposition Progress

The board of directors of the Forest Products Exposition Company met Jan. 15 at the Blackstone hotel, Chicago,

Pursuant to the action of the stockholders of the Exposition company at the meeting held to-to-her 1, 1943, the board of directors resigned in favor of the members of the board of governors of the National Lumber Manufacturers' Association, subject to their qualifications at a meeting to be held January 28, 1944.

It is understood that the beard of governors to qualify as directors on the date named, will, in turn, elect the officers of the National Lumber Manufacturers' Association as officers of the Forest Products Exposition Company, and will appoint the members of the board of directors who have just resigned, as members of the Forest Products Exposition committee of the National association in full charge of the affairs of the exposition.

The secretary presented a report showing that of the 500 shares of capital stock of 850,00 each, 320 shares have been issued and paid for, and 125 shares additional are definitely subscribed for, thus leaving 55 shares of the total issue yet to be sold. It is not anticipated that there will be any difficulty in selling these.

Contracts for space in the Chicago Coliseum and in the Grand Central Palace. New York, already signed and definitely promised cover nearly two-thirds of the available space in both buildings. The following associations are now engaged in the preparation of plans for the exhibits: Northern Pine Manufacturers' Association. Southern Cypress Manufacturers' Association. North Carolina Pine Association combined exhibit by the Michigan Hardwood Manufacturers' Association and the Northern Hendock & Hardwood Manufacturers' Association, the California Redwood Manufacturers' Association. Sum Lumber Manufacturers' Association of the L. S.

The following associations have asked for reservations of space, and are making plans to contract for it: Yellow Pine Manufacturers' Association, West Coast Lumber Manufacturers' Association, Hardwood Manufacturers' Association of the U.S., National Association of Box Manufacturers, Crossoted Wood Paving Block Association, American Wood Preservers' Association

In addition to the above, there are a large number of firms, including manufacturers of oak lumber, maple flooring, cooperage stock, furniture, wooden novelties, veneer products, shingles, wooden handles, paving blocks, and manufacturers of various other forest products, who have contracted for space, or have asked for reservation of same. Sufficient space has already been reserved to make it possible to say that the entire space in both exposition buildings will be contracted for in the near future.

A splendid series of moving picture exhibits, covering many branches of manufacturing, is assured.

The \$10,000 appropriation asked for by the Forest Service to enable it to make an adequate exhibit, is believed to be assured; and participation is also promised by the American Forestry Association, New York State College of Forestry, and the Indiana State Forestry Commission.

The Lumbermen's Association of Chicago, representing all branches of the industry in this city, desires to act as host to the lumbermen and others who will visit the exposition here, and has appointed a reception committee of 100 members, with authority to arrange proper entertainment. Similar action is contemplated by the lumbermen of the city of New York.

Arrangements have been completed covering the terms of fire and liability insurance, installation of power and lights, transportation of exhibits by special train from Chicago to New York, and are now being made for the general decorative features of both shows. Exhibitors are relieved of all worry in these particulars.

Hardwood and Cypress Men Unite

At a meeting of the cypress branch of the Georgia-Florida Saw Mill Association recently held at Jacksonville, Fla., it was decided to enlarge the scope of that branch so as to include in its membership cypress and hardwood manufacturers of the South Atlantic states. The members feel that they have thus added a strong asset to their association in making this body the same factor in the cypress and hardwood lines as it has in the yellow pine industry. Up to this time hardwood has been neglected, and as there is a large quantity of it in this territory it will now enter largely into the business of the association.

With the Trade

Wisconsin Mill Begins Operations

The new point of the 1 meb wl. Vene (a. Boy Company made its trial into n. N.w. Yerreda, at 1 ch. hewk. Wis, and the test was pronounced a greed (b) of the 4 min in the point will employ between sixty and seventy men, but this number will be increased to one hundred later on. The factory has a daily capacity of from 2,000 to 3,000 cheese boxes in addition to veneers, house etc. The factory is built on the site of the Bradley company's plant. The officers of the company are Reinhard Movel (c) daily Julius Gronoll, venepresident; W. H. Willermott, it as sixty for a 2 d Marky secretary. May Meyer is manager

Mill Resumes Operations

Employing a force of fifty five men, the Ohio Valley Bending Company at Parkersburg, W. Va., resumed operations early in January, after having been shut down for over a year, with a large number of orders on hand. Improvements of an extensive nature have been made to the plant, which has been completely renovated, and among other things two new gas engines have been installed, replacing steam engines.

Company Name Changed

The Florence Wagon Company, capitalized at \$300,000, succeeds the Florence Wagon Works, Florence, Ala, The incorporators of the new company are S. S. Broadus, Decatur, and C. W. Bransfore and H. A. Bradshaw, Florence. The manufacturing facilities at Florence will be enlarged as a result of changes made.

Will Make Chair Stock and Heading

The Tucker Timber Company, Elkins, W. Va., has been incorporated with a capital of \$50,000. The officers of the company are: J. S. Posten, president; J. T. Davis, vice-president; W. C. Posten, secretary-treasurer. The new corporation will creet a plant in Tucker County, West Virginia, and will manufacture lumber, chair back stock and oil barrel heading.

Another One

George H. Schotte, vice-president of the Thompson Hardwood Lumber Company of Cincinnari, is the lather of a recently born addition to the hardwood trade of Cincinnati. Roy S. Schotte, five weeks old, judging from the lusty way in which he orders his newly found parents about, is destined to cut some figure in the lumber trade of the future. Roy S. is the third of the new generation of Schottes, having been preceded by George and Harry.

Change of Operations

The Smith & Bent Lumber Company, formerly of New Haven, Conn., announces that it has changed its corporate name to the Smith Lumber Company and has moved its operations to the Oliver building. Boston, Wass

Work on Ferd Brenner Mill Progressing

Work on the big new mill of the Ferd Brenner Lumber Company in the southern suburbs of Alexandria, La., is progressing nicely. The mill will be a thoroughly up to date bardwood plant, modern in every particular. Machinery is the newest and most modern to be had and the building is being constructed along lines to facilitate the handling of the material in the best manner possible.

An Unusual Calendar

In the last issue Hardwood Record there was a Chicago news note acknowledging receipt of a handsome calendar from the R. E. Wood Lumber Company of Baltimore, Md. The calendar depicted a beautiful photographic view of a mountain scene in North Carolina, but the concern which issued this masterpiece overlooked enclosing descriptive literature. Hence, the description was necessarily limited,

The title of the picture shown is "Eagle Creek Valley from the Summit of Thunderhead." It gives a view of a magnificent height and distance. The sheep pasture in the foreground, from which point the scene was photographed, is a bald knob near the summit of Thunderhead Peak, which is the highest point of the Great Smoky Mountains in Swain county, North Carolina. From this altitude, 6,000 feet above sea level, can be seen the vast number of high peaks of the Appalachian range, looking east from this point as far as Mt. Mitchell, in view on the northeast, as well as Mt. Toxaway, to the southeast.

The territory embraced in the view is the wonderful timbered valley of Eagle Creek, which from this height, immediately above its source, finds its way over a southerly course of about eighteen miles until it joins with the Little Tennessee river at Fontana, N. C. The scene embraced by the photograph covers about 20,000 acres of virgin forcest, consisting of great quantities of fine native woods, such as yellow poplar, red and white oak, chestnut, busswood, ash, maple, birch, etc., and a liberal sprinkling of white pine is also included. The property is owned by the Montvale Lumber Company, Baltimore, Md., and at Fontana, a villaze founded by this concern in 1908, the company has located one

of the most complete band sawmill equipments to be found in the mountain region of the southern hardwood section. The products of this operation are being sold on the market by its associated company, the R E. Wood Lumber Company, also of Baltimore.

Will Build Hardwood Plant

R. W. Hamilton of Elkins, W. Va., a member of the firm of Hamilton Brothers, has bought a small tract of fine hardwood timber near Marion Center, Pa., and will put in a plant at once to manufacture it.

Opens Office as Forest Engineer

D. E. Landerburn, forest engineer, announces that he withdrew as a member of the firm of Vitale & Rothery, New York, on December 31, and that he is now engaged in business of timber estimating and in every branch of forest engineering, with offices at 56 Worth street, New York N. V.

Will Open Hardwood Region

The building of the proposed railroad through Hardy, Pendleton and Pocahontas counties, West Virginia, and Highland county, Virginia, will open a rich hardwood region, which likewise contains much hemlock and spruce and some white pine, as well as extensive fron ores. The road will cross the Allechany mountains from the headwaters of the south branch of the Potomac river to the sources of the Kanawha river, a tributary of the Ohio. It is of interest that one of the earliest railroad surveys in America, made by engineers of the Baltimore & Ohio railroad eighty-five years ago, followed practically the same route as that on which it is now proposed to build. The old route was rejected in 1829 because a railroad there would strike the Ohio river too far south. No railroad of that time crossed the Alleghany mountains, and the promotors of the infant Baltimore & Ohio line were aiming for Pittsburgh.

New Factory at New Orleans

It has been announced that oars, golf sticks, handles, shuttleblocks and other bardwood articles will constitute the principal product of the mew plant of the Anchor Saw Mills Company to be built at New Orleans, La. A site has been purchased on the river just above the city where a convenient landing can be had for rafts and barges which will bring logs down the river. Work on the plant will begin at once, and when in operation eighty men will be employed.

Large Hardwood Mill for Oklahoma

Between 300,000,000 and 400,000,000 feet of cottonwood and oak timber have been purchased by H. A. Waddell, H. J. Williams and associates of New Orleans, La. The tract is located on the Washita river near Islesworth, Okla. A mill with the capacity of 50,000 feet is to be erected at once. Crossies and lumber will be manufactured. Mr. Waddell will be in active charge of the operation.

Death of Veteran Michigan Lumberman

On January 1, William A. Phelps, president of the Hackley-Phelps-Bonnell Company, Grand Rapids, Mich., and Hackley, Wis., passed away. Mr. Phelps was one of the old school of Michigan lumbermen and has been operating in various parts of Michigan for years. He has been actively connected with the Hackley-Phelps-Bonnell Company since its incorporation, spending most of his time at the company's operations at Hackley. Wis

Mr. Phelps' long connection with the Michigan lumber trade has made for him many friends and his death is considered as a distinct loss to the lumber trade.

Death of John R. Whiteside

At Joplin, Mo., Jan. 9, 1914, occurred the death of John R. Whiteside of that place, at the age of sixty-five years. He was a native of Illinois. He was identified with the lumber business twenty-five years, part of the time in Chicago, where he was identified with George T. Houston & Co. He had been with the Kelly-Maus Company, and was also in business for bimself. From Chicago he went to Duluth, where he was connected with the Kelly Hardware Company. Later he was identified with the J. M. Durneil & Son Company at Memphis, Tenn. During the last few years he was traveling salesman for the Lamb-Fish Lumber Company, the Goodlander interests and the Baker Lumber Company.

Death of Robert N. Archer

Lumber manufacturers and wholesalers throughout the hardwood field learned with regret of the death January 10 of Robert N. Archer, formerly one of the most prominent hardwood lumbermen in the United States. Mr. Archer, who died at the residence of his daughter, Mrs. Frank K. Rodman, at Evanswood avenue and Cornell place, Clifton, Cincinnati, was one of the organizers of the National Hardwood Lumber Association. was widely known in lumber circles throughout the country, and especially the South, up to the time of his retirement about fifteen years ago. He organized the Kentucky Lumber Company in the early eighties. The company started mills at Frankfort, Burnside and Williamsburg, Ky. At that time the output, in addition to poplar, oaks and other hardwoods, consisted largely of walnut. 'The Kentucky Lumber Company since his retirement has continued its growth. Mr. Archer had been in poor health for some time and death was not unexpected. Since his retirement from active business affairs he had traveled extensively, spending much time abroad, in California and in Florida,

Pertinent Information

November Wood Imports and Exports

During November, 1913, the imports of rorest products into the United States was as follows: Mathegany from various countries, 3.549,000 feet, valued at \$289,024; other lumber 108,569,000 feet, value \$2,061,603; wood pulp 85,640,435 pounds, value \$1,210,653.

The exports for November were: Round timbers 8.175,000 feet, value \$219,687; firewood \$11,410; square timber 18,356,000 feet, value \$385,624; lumber 168,115,000 feet, value \$3,203,968; joist and seamtling 711,000 feet, value \$11,754; railroad ties 221,150, value \$127,326; shingles 1,856,000, value \$52,204; box shooks 1,247,594, value \$116,018; all other shooks 144,641, value \$210,402; staves 6,300,608, value \$387,874; heading \$52,570; all other cooperage \$196,632; sash, doors and blinds \$135,484, furniture \$677,978; empty barrels \$99,011; incubators and brooders \$15,176; house finishings \$70,104; woodenware \$56,423; wood pulp 2,620,697 pounds, value \$51,525; all other \$555,433; total exports \$73,883;

Reaching the Whole World

Manufacturers of woodenware at Munising, Mich, announce with pardonable pride that their commodities reach practically every country of the civilized world. Among the articles of woodenware which go to wide and varied markets are sugar maple bowls, butter moulds, ladles, enameled and plain handle rolling pins, baker's rolling pins, pastry rollers, cake rollers, spades, mixer spoons, kraut forks, potato mashers, dippers, meat carving boards, bread plates, seissors and pincher fish tongs, clothes line reels, crown clothes lifters, towel racks, churn dashers, variety turnings and various other articles, to which they are constantly making additions.

Finding Foreign Markets

The wide demand for southern hardwoods is apparent from the fact that a single mill, that of the Lamb Fish Lumber Company at Charleston, Miss., shipped lumber to eighteen different states during last month, besides filling large export orders for England, Germany, Scotland, Italy, France, Begium and Canada.

Machine for Resawing Glued-Up Blocks

In this connection is shown an illustration of a machine recently bullt for the Victor Talking Machine Company, Camden, N. J., for the resawing of blocks, glued up to various dimensions, as, for instance, approximately ranging from 20" to 4' long and up to 16" by 20" square. Much of this material is termed by the Victor people as "horn stock," which is sawn on a bevel so as to make the horn stock consist of several pieces, glued up something on the principle of the sounding board of a plane.

The machine, as will be noted, forms a complete miniature sawmill with carriage, offset, etc., all embodied in the one single, self-contained machine.

The machine as built is provided with two rates of feed, this being accomplished by a novel two-speed countershaft; but while there are two rates of feed, the rate of the reverse is constant. Thus, the countershaft may be speeded to give rates of feed 25 to 50 feet, respectively, and a reverse at 100 feet, or 20, 40 or 80, as might be desired. The feed and reverse are automatic, but the setting is accomplished by miniature ratchet set works, working on the same principle as the large single acting set works of the standard band mills in common use.

The dogging of the blocks is accomplished in a novel manner by the use of an air cylinder, the blocks being dogged from the end. All that is necessary in order to securely dog the block for sawing, is to turn on the air pressure, which engages the dog with the end of the block, securing it as firmly as in a powerful vise. When the sawing is completed a movement of the lever controlling the valve in the steam chest of the cylinder withdraws the dog and releases the block, when it is ready to receive a new block or cant.

The carriage is controlled readily by means of a convenient shifter for throwing the feed and gig belt on the loose pulley, and in order to secure instant arrest of the carriage at any point desired, a suitable brake, operated by foot is provided. As will be seen by the photograph, the machine is symmetrical and complete in all its details, and shows that it has been most carefully thought out. It is recommended to anyone having bolts to saw into staves, heading, handle stock, or in fact for any of the thoughand and one uses for which the machine is adapted. Further particulars will be most cheerfully supplied by writing the manufacturers, Wm. B. Mershon & Co., Saginaw, Mich.

Car Statistics

The American Rullway Association announces in its bulletin of January 22 regular figures on car surplus and shortage. The total surplus January 15, 1914, is 217,274 cars as against a surplus on January 1 of 190,521 cars. The surplus on January 15, 1913, was but 53,230.

The shortage on January 15, 1914, was 2,385 cars and on January 1, 1914, it was 1,671 cars. The shortage January 15, 1913, was 24,791 cars.

The natural interence is that the renewed netivity in orders had not yet up to the middle of the month definitely affected actual shipments. It will be interesting to note the future changes in these figures.

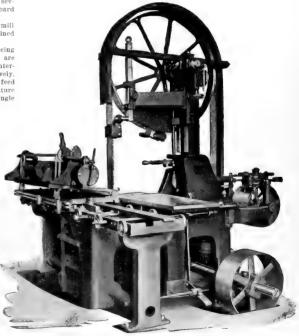

Important Decision on Switching Charges

A decision of importance to lumbermen because it affects one material Item of expense in their business, that of switching charges, was handed down by the Maryland court of appeals on January 15 in the case of the Northern Central Railway and other railroads operating in the city and in Baltimore county. The court struck down an order of the Public Service Commission, which had sought to reduce and regulate connecting line and switching charges. It was held by the court that the portion of the commission's order which refers to connecting lines and intermediate switching is unlawful, because the rates fixed by the board's order for such a service are unreasonable, and that it does not appear that the rates fixed by the companies for yard and industrial switching are unreasonable. The ruling affirms the decree of Part 2 of the Circuit Court of Baltimore, where the action was originally brought, the lower court having made perpetual an injunction which restrains the commission from enforcing the provisions of its order relative to connecting line and intermediate switching. The shippers had contended that the rates charged by the railroads with terminals in Baltimore for switching were too high and imposed a burden upon shippers, which put them at a serious disadvantage as compared with The court concerns engaged in the same lines of business in other cities. of appeals' decision seems to end the matter in so far as the shippers are concerned. Only in so far as it applies to yard switching-that is the movement of cars from one point on a railroad to another on the same tine-does the order of the commission stand. That is, the decision has no bearing whatever on any question or treight not coming under the category suggested.

Arkansas Rate Matters

On January 17 United States District Judge Jacob Trieber of Little Rock made permanent the injunction against shippers and passengers, restraining them from suing for excess fares and freight collected by the railroads of Arkansas during the period of the Arkansas rate cases littigation. The particular case in which this decision was rendered arose out of a suit brought by Allen Smith of Cotter, Ark., in the Baxter County chancery court against the Iron Mountain railroad to collect certain overcharges. Upon application of the attorneys for the railroads Judge Trieber issued a temporary restraining order against Mr. Smith and on January 17 made the injunction permanent.

Judge Trieber set up as his reasons for making this permanent injunction that the federal court, by reason of its jurisdiction of the main issue regarding the Arkansas rate cises, has anciliary jurisdiction to determine

A RESAW FOR GLUED UP BLOCKS.

t such the federal court has exceed to be a first Jacobian to the federal court has the right to restrain and the approximated from the cause and any other court. He matther stated that in view of the fact that each claimant had a separate cause of action and it allowed to such indiscriminately a multiplicity of suits in the state courts would result, and in view of the further fact that it will be necessary to construct the action of the federal court in the main case, which according to his idea should be done by the federal court itself, be retained mirishitton in all cases.

Quating from a Supreme Court decision, Judge Trieber said: "The prevention of conflict of authority between state and national courts, and the protection and preservation of the jurisdiction of each frection the encroachments of the other, are considerations which lie at the very foundation of aneither jurisdiction."

In view of the fact that the lime has expired, January 1, 1914, for filing the claims against the Iron Mountain railroad with the special master of the federal court, the recent decision of the federal court means that no more claims can now be made against the St. Louis, Iron Mountain & Southern railroad. Although the St. Louis Southwestern railroad was not included in the case above mentioned, the same con ditions apply to it, as this road was also involved in the main Arkansas rate cases, decided by the United States Supreme Court recently, and the special master of the federal court was appointed to receive claims against that road also.

On January 16 Henry Armstead, of the law firm of Cockrill & Armstead of Little Rock, made the opening argument before the Interstate Commerce Commission at Washington in the case of the Wisconsin & Arkansas Lumber Company and seventeen other lumber companies against the St. Louis, Iron Mountain & Southern and other raffroads, involving the blanket rates on lumber from Arkansas, Louisiann and Texas points to Ohio river points. Judge Sam II. Cowan of Fort Worth, Tex., appeared in behalf of the Texas and Louisiana lumber companies, and urged the retention of the present rates. The Arkansas lumber mills are seeking to break the present blanket rates providing for the same charges in hauling lumber from Arkansas to Ohio river points as are made from Louisiana and Texas, some 400 or 600 miles farther, to the same Ohlo river points.

Cottonwood in the Mississippi Valley

The Department of Agriculture has published a bulletin dealing with the problem of the cottonwood supply in the Mississippi valley. It was written by A. W. Williamson of the Forest Service. It contains interesting information concerning the use and value of cottonwood in the past, but the main purpose of the publication is to set forth the possibilities of growing new supplies to meet the country's needs. The lower Mississippi valley is considered the most promising region, because its soil and climate insure the most rapid growth and the largest size, but the cottonwood grows fairly well in most parts of the United States where moisture is sufficient. Where seed trees abound there is seldom any necessity to plant cottonwoods, because the tree is an abundant seeder and the wind scatters the seeds widely. As many as 40,000 seedlings have been counted on a single acre, but all except a hundred or so will be crowded to death before the trees reach large size. However, a good acre of cottonwood will produce 15,000 or 20,000 feet of logs in thirty-five or forty years. Those who have land with young cottonwoods on it, or which is suitable for this tree, will find the bulletin just issued to be a valuable source of information.

Baltimore Export Figures for 1913

The figures relative to the export trade in lumber, logs and wood products from Baltimore are available for the last year, and they tend to show that the aggregate result of the year's activities for the exporters is better than the returns for the various months had indicated it would be. The monthly statements showed almost invariably a reduction in the quantities and corresponding declines in values of exports, the trend having been downward since last spring. It appears from the full showing, however, that gains in certain directions served to make up in large part for deficiencies in others, so that the aggregate appears decidedly more favorable than exporters had reason to feel it would be. Taking all of the exports items together, it seems that the value of the exports for 1913 was a matter of somewhat more than \$100,000 below that for 1912. To be sure, this represents a large quantity of lumber, but cuts no very great figure alongside of the grand total of two and a quarter millions for the year. The decline, as was to have been expected, proved most pronounced in oak, the flooding of some of the foreign markets with oak planks having served to check the movement to a great extent. The exports of oak lumber dropped from 30,244,000 feet in 1912 to 23.888.000 feet in 1913. Oak logs fell from 306,000 to 208,000 feet, hickory from 1,564,000 to 1,185,000 feet. The freedom in the poplar movement, on the other hand, is shown in an increase from 2.524.000 to 3.741.000 feet, and the classification of "all other lumber" rose from 2,989,000 feet to 4,753,000 feet. Of white pine there was not a foot exported in so far as the records of the custom house here go, while reductions are to be noted in the shipments of gum and cypress. Altogether it was not a favorable year for the exporters, whose expectations had been raised by a brisk demand early in 1913, only to experience the all effects of congestion before the summer was far ad

varied. The tatement 1 exports, with the exception of various items not to be classed among bardwoods, and divided into logs, lumber and manufactures of wood, is as follows, the figures for 1913 being given in comparison with those for 1912, so as to show the extent of the decline or increase in the various items.

Importance of Ozark Hardwoods

The growing demand for the hardwoods of the Arkansas Ozark mountains is being felt by the Harrison headquarters of the Ozark National Forest. With the diminishing of the supply of hardwoods in Tennessee, Kentucky and other states where hardwoods were once abundant the demand on Arkansas is increasing. The indications of the demand are probably being shown more strongly by the numerous applications for the privilege to buy timber from the national forest than in any other way.

Recently a sale of 1.300,000 feet of white oak timber to be cut from the Ozark National Forest in Stone county, Arkanasa, was awarded to these & Wymond of Louisville, Ky. This contract was the result of an application made to the Ozark National Forest, and under the terms of the contract the lumber company is to remove the timber by December 31, 1914. This is but one of the many contracts of a similar nature by which the federal government is improving the national forest reserves in this state by the removal of the mature timber, which gives room for the oncoming young timber.

The government foresters have made a careful study of the rate of growth and the amount of the old and young timber on the ground and have determined that 12,000,000 feet of timber, mostly white oak, can be safely cut each year from the Ozark national forest without injuring the future supply.

The sales of timber from the forests serve to nourish the woodworking industries in Arkansas and also to create revenue for the immediate benefit of the present generation in the way of constructing roads and improving school buildings. Under the arrangement by which the national forest contracts are sold thirty-five per cent of the amount received reverts to the states from which they originate and this amount is devoted to road building and school improvement. A concrete example of the improvement being made by this means is seen in the new road which has recently been constructed by the forestry officers in charge of the Ozark national forest in Stone county, at a cost of \$1,600.

The national forests of Arkansas, including the Ozark national forest and the Arkansas national forest, are the only bodies of protected hardwoods of their size west of the Mississippi river. The timber from those forests is not only sold to manufacturers under the above plan, but is also sold to the settlers for the purpose of improving their claims. Settlers whose funds are insufficient to buy timbers from these forests are allowed to cut certain designated trees the value of which does not exceed \$20.00 each year. These timbers are used for building purposes and constructing fences. Timber is also donated under the forest reserve plan to communities for the building of schools and churches and for the building and improving of roads.

Building Operations for the Year

The December showing of building operations throughout the country is eminently satisfactory-that is, satisfactory in comparisons for the returns for other months during the latter half of 1913. There is a loss as compared with the operations of December, 1912, but it is a small loss, only five per cent, a much smaller loss than that shown in November. The reports from 70 cities received by the American Contractor, Chicago, show that building permits reached a total valuation of \$57,266,319, as compared with \$60,280,282 for December, 1912, and a specially interesting circumstance is that a number of cities show rather phenomenal gains. Thus the permits issued in Buffalo for the month gain 257 per cent; in Cedar Rapids, 216 per cent; in New Haven, 516 per cent, and in Wichita, 649 per cent. In the last named city there were three new works of importance, the Wichita public library, an addition to Wichita hospital and three handsome, modern public school buildings. Of the 70 cities in the list 33, or almost one-half, show gains, important improvement, besides the above, being recorded as follows: Birmingham,

136 per cent; Columbus, 474 p. (c) 0 % and, 408 per cent; St. Paul, 126 per cent; Topoka, 114 per cent;

The returns 4.5m 60 cities show the solding permits to the value of \$722.378,100 for the entire van 1945 — spared with \$832,202.348 for the year 1942 a less of 46 per cold. It was become report as any Indication the pendulum has begun to swing again towards improvement. Details are as softons.

Michigan Forestry Students Study Operations

Prof. F. H. Sanford, head of the forestry department of the Michigan Agricultural College, accompanied by Instructor Gilson and a number of college students of forestry, has just returned from Davis, W. Va., where they have been studying the methods of mountain logging and lumbering as employed by the Babcock Lumber & Boom Company. The men roomed in a small hotel at Davis, but took their meals at the company's camp.

The Babcock concern showed every courtesy to the Michigan men and provided them with a special train for visiting the two camps maintained. The methods of logging by cable, boom operations and every phase of mountain lumbering and logging were gone into during the trip.

The Lumber Output for 1912

Final statistics of the production of lumber, lath and shingles in the United States for the year 1912 are presented in detail in a builetin issued by Director Harris of the Bureau of the Census, Department of Commerce, and dated January 26, 1914. It was prepared under the supervision of W. M. Steuart, chief statistician for manufactures.

The report shows that a total of 29.648 mills was reported as having been in active operation in the United States during the year 1912, as compared with 28,107 for the year 1911, and 31,934 for 1910.

The total amount of lumber produced, in M feet board measure, in 1912 by these mills was 39,158,414, as compared with 37,003,207 in 1911, and 40,018,282 in 1910.

The showing for the year 1912 indicates generally improved conditions in the lumber industry. Although the total reported cut was slightly less than in 1910, the average yield per mill was 5.3 per cent greater than in that year, while the total production over 1911 was 2.155,207 M feet board measure, or nearly 6 per cent. The degree of activity in the lumber industry during 1912 as tellected by the figures is especially noteworthy, the output exceeding that of four years earlier. 1908—by nearly 6,000,000,000 feet board measure, or 17.9 per cent.

Increases among the individual states were quite general, slight exceptions appearing in certain of the casts ra states and a tew of the western mountain states. The asual decrease in the output of the Lake states which has characterized the showing for several years was due directly to the rapidly decreasing supply of lamber material in that region. While both the principal lumer producing centers, namely, the southern states and the Pacific Coast states, reported larger ents in 1912 than in the preceding year, the increased production in the first named group was substantially greater than for the United States as a whole. The development of the lumber industry in the southern states during recent years has been rapid. At the coasts of 1900, 38.7 per cent of the total production in the Paritted States was reported from that region, while in 1907 it centributed 45.7 per cent of the output, and in 1912, 51.4 per cent, or more than one-being of the total.

The production reported from Washington in 1912 was the largest recorded sline 1906. Although for nearly a decade this state has led all others in the production of bunder and shingles, in 1912 it contributed more than one tenth of all the lumber and nearly two thirds of the shingles manufactured in the United States. The state of Louisiana ranked second; Mississippi, third; North Carolina, fourth; and Oregon, fifth.

Of the reported total lumber production softwoods contributed 30,526,416 M feet board measure in 1912, as against 28,902,388 M feet in 1911, and 31,160,856 M feet in 1911, are reported cut from yellow pine tillmer in the territory comprising the Atlantic and Galf Coast states from Virginia to Texas, inclusive, together with Missouri, Arlamsas and Oklahoma, during the year amounted to 14,737,052 M feet board measure, or about ninety-cight per cent of the total output from this species in the United States, Douglas fir, the species which ranked next to yellow pine among the confers or softwoods, supplied material for 5,475,423 M feet board measure. The production from both of these species was greater in 1912 than in the preceding year. White pine ranked third among the softwoods in 1912, though the cut from this wood was smaller than in the preceding year and has been declining steadily for several years.

The reported cut of hardwood lumber in 1912 was 8,631,998 M feet board measure, as against 8,160,819 M feet in 1911, and 8,857,426 M feet in 1910. To this total, oak, the leading hardwood species, contributed 3,318,952 M feet, or 38.4 per cent, and showed an increase over the output for the preceding year of 220,508 M feet, or 7.1 per cent. Maple, red gum, tulip, poplar, chestnut, beech and birch followed oak in the order named.

The production of lath and shingles in 1912 did not differ materially from the output of these products during the preceding calendar year, although each was reported in slightly smaller quantities than in 1910.

Forest Fire Losses in Michigan

Losses by forest fires in Michigan which have approximated upwards of \$1,000,000 annually for 50 years, dropped from \$3,400,000 in 1911 to \$67,000 in 1912 and to less than \$23,000 in 1913, according to the annual report of State Forestry Warden William R. Oates which was sent to Gov. Ferris recently.

Warden Oates says that his department cannot in fairness claim more than a nominal credit in the diminution of forest fires. It submits that the curbing, suppression and prevention of forest fires and the resultant reduction of loss is due to a systematic and thorough organization of the township supervisors of the forest district as local fire wardens and the educational posters and literature on the suppression of forest fires, placed through them before the township communities.

The improvement and standardization of locomotives and rights-of-way inspection helped materially, while the moral enlistment of 3,000 school boys of the forest district as Michigan Forest Scouts, with the prime purpose of prevention of forest fires and reforestation, was an important factor.

Among the other important agencies in preventing fires was the protective service instituted by the public domain commission on its reserves of state lands; the practical and energetic field work of the several independent lumbermen's protective associations; the splendid publicity given by the city and country press of Michigan on all matters pertaining to forestry and the prevention and suppression of forest fires.

Notable in view of the marked reduction of loss by forest fires is the fact that many more were reported to the department in 1913 than were reported in 1911, when the loss on merchantable timber and other readily estimated property was stupendous.

Following the disastrous fires of 1911, culminating in the destruction of the populous towns of Oscoda and Au Sable, the forestry warden exploited the organization of the school boys of the district for forest fire service. In 1912 there were 1,500 enrolled as auxiliaries to the state fire warden's department under the title of Michigan Forest Scouts. Besides extinguishing 509 fires, some of which were of considerable magnitude, the scouts did effective work as messengers for the regular wardens and supervisors and as educators in forest fire prevention. In 1913 the Forest Scouts increased to a membership of 3,000. They more than duplicated the work of the previous year with a record of 731 fires ex-

 $_{\rm coll}$, $_{\rm coll}$

Instantich as it has been noted that many forest fires were set by alien innutranity, a special effort has been made to acquaint this class of people with precentive knowledge. Among the foreigners of Marquette, Baraga, Iron, Houghton and Ontonagon countles, scout companies for the several nationalities have been organized and the English text in fire nighting has been translated by iceturing interpreters.

On the 200,000 acres of timber lands controlled by the public domain commission steady and appreciable procress has been made in the care of the forests. In the separate reserves of Luce, Roscommon, Houghton and Grand Praverse counties the best methods of the federal Forest Service in retorestation, fire prevention and encouragement of supling and older growths are in use. Watch towers and fire lines guard the danger points of heavy ground litter which is under constant surveillance during the dry season.

Summing it up, it is conservative to assert that the net results of torest fires in Michigan in 1912 has proven, for the first time in 60 years, a benefit rather than a loss. This conclusion does not warrant any feeling of real security in the control of forest fires in the future. for it is evident to all familiar with the situation that without the aid of supplementive agencies the provisions made by the state would be grossly inadequate. The independent patrol by the lumbermen has no positive guarantee of continuance and the scout work of the school boys is the result of patriotism which this department can ask for but not command. In the countries of Ontonagon, Marquette, Dickinson, Delta and Luce there are more square miles of fire trap slashings guarded by a state fire fund of \$10,000 than in the entire state of Minnesota where the annual fire tighting fund is more than \$100,000. In the lower peninsula, Cheboygan, Charlevoix, Presque Isle, Montmorency, Crawford, Kalkaska, Missaukee and Wexford counties contain large areas of dangerous slashings which are a continual menace to life and property.

In Warden Oates' report to the governor he recommended provisions which would make the fire patrol less dependent upon volunteer help.

Proposed Large Timber Sale

It is announced that the Forest Service proposes to sell a large body of timber in northern Arizona and will receive bids until June 15, 1914. The quantity is estimated at 1,000,000,000 feet, consisting of western yellow pine and Engelmann spruce. The minimum bid that will be considered is two dollars a thousand feet for the pine and \$1.40 for the spruce. The price will be revised every five years to conform to changes in lumber values.

The timber to be offered is now inaccessible and if it is sold it will mean the building of nearly two hundred miles of railroad to carry the lumber to market. Incidentally, this will open a large region which has other resources besides its timber. The lumbering will not destroy the forests, because only mature trees will be cut, and the young growth will be left.

Three years will be allowed the purchaser to build the railroad into the region. The output will be about 40,000,000 feet a year, and it is expected that the market for it will be found in Utah and Colorado. The timber is situated in the Kalbab forest.

Peculiar Forest Products

The interior of China sends some peculiar commodities to the United States, according to a recent report by Consul E. C. Baker, who is stationed at Chungking, a city a thousand miles inland, with poor means of communication with the coast. Two of the commodities exported are fungus and nut galls, both presumably obtained in forests. In 1912 the fungus sent out of the country amounted to 126,640 pounds and the nut galls 190,380. These articles are used in the arts. Nut galls grow on leaves and twigs of trees, such as occur on oak trees in this country. They are valuable in link and dye making. Vegetable tallow, amounting to 34,330 pounds, is exported from that country. The Chinese tallow tree has been successfully introduced into Texas, and is growing about Brownsville. By and by we may raise our own vegetable tallow.

Persian Oak

Timberland lookers have a long journey ahead of them when they set out for Persia; but reconnaissances have recently been carried on there by both French and English lumbermen looking for oak suitable for cooperage and crossties. The explorers were rewarded by finding large forests of oak, but in regions so remote from means of transportation that hundreds of thousands of dollars will be required to organize the business and open up the resources of the regions. An English company has already opened headquarters at Gilian, but the plans of the Frenchmen have not been amounted.

Expanding Force of Wet Wood

Quarrymen in France split enormous blocks of stone by inserting wooden pins in small holes along the proposed line of cleavage, and then soaking the pins with water.

An illustration equally as convincing was provided at Dayton, O., during the flood last spring. A quantity of oak dashes veneered with

maple was stacked to within one inch of a reinforced concrete girder in the basement of the factory of the Maxwell Motor Car Company. This girder had a cross-section of 12 by 10 inches and supported a 6-inch reinforced concrete floor.

The basement was flooded, and after the water deceded it was found that the girder, together with the concrete floor which it supported, had been lifted three inches. Ten weeks after the flood the girder still rested on the dashes, but it had settled about three-fourths inch.

Large cracks developed in this girder, starting at the edge of the pile of dashes and extending upward and outward. These cracks extended from the bottom to the top of the section at an angle of about 30 degrees with the horizontal. It was necessary to replace this girder and a section of the floor.

Locust Trees Reported Dying

The locust timber in central West Virginia is said to be dying throughout large areas, and lumbermen who deal in fance posts and insulator pins are much disturbed on account of the disease. The cause of the trouble seems to be unknown. This region is the natural home of locust, and the species there reaches its highest development in the United States. Heretofore the locust borer, which has done so much damage elsewhere, has been practically unknown in that region.

Possible Substitute for Boxwood

Turkish boxwood of which rollers for skates, high-class rulers, and expensive engraving blocks are made, has become so scarce that the enomously high price paid for it is not sufficient to produce the quantities needed. The search for substitutes has gone far and wide without satisfactory results, unless the latest discovery will answer. This is a wood which grows in eastern Africa, in the Mozambique country, and in that region is known as makruss. The tree's botanical name is Androstachys johnsonii. It flourishes only in the vicinity of streams but is frequently abundant in such situations. The size is limited to two feet in diameter and forty in height. The trunk is largely heartwood, and in color is yellowish brown. In several points it resembles the sandalwoods. It has a bitter taste. Tests are being made to determine whether it will serve as a substitute for boxwood in its most exacting uses.

One of the regular entertainment features as gotten up by the entertain ment committee of the Lumbermen's Club of Chicago was vaudeville and stag given on the evening of Saturday, January 17. Those attending were entertained by six numbers, including comedy-musical act, cabarrel girl performance, negro comedian, harmony singers, toe dancer and popular ballads,

HARDWOOD RECORD is in receipt of a letter from the George Webster Lumber Company, Springfield, Mass., stating that that concern is opening an office at Cleveland, O., in room 1166, Leader building. This office will be in charge of George B. Jobson.

Hardwood Record is in receipt of a notice from the London Hardwood Company, Ltd., 11 and 12 Clements Lane, London, E. C., stating that since December 29 that concern has been located at Gracechurch buildings, Gracechurch street, London, E. C.

HARDWOOD RECORD is in receipt of a handsome calendar from J. D. Lacey & Co., McCormick building. Chicago, tumber bond factors, showing some immense western pine trees.

The Southern Pine Company of Georgia, Savannah, Ga., with offices in New York City and Jacksonville, Fla., has sent out a very unique calendar showing a picture of a beautiful girl around which is placed an individual frame design, giving it the appearance of a framed photograph.

Wistar, Underhill & Nixon, wholesale lumber dealers, Real Estate Trust building, Philadelphia, Pa., has supplied HARDWOOD RECORD this year as for a few years previous, with a calendar containing fifty-two sheets, one for each week of 1914.

=< PHILADELPHIA **>**=

E. M. Bechtel, sales manager, William Whitmer & Sons, Inc., says although prices in some lines fell off considerably during the latter part of last year, they moved a large volume of stuff and so have every reason to be satisfied with the year's business. So far this year they have no complaint to make.

Benjamin Stoker of George W. Stoker & Son says the October, November and December trading was way ahead of last year, but so far January has been quiet.

The Forest Lumber Company is enlarging its capacity by putting a Clark resaw in its mill in Komarock, Va. It also has purchased a 120-ton locomotive. F. X. Diebold, president, says last year's business was eminently satisfactory and so far trading is fairly responsive.

To J. Randall Williams, Jr., of J. Randall Williams & Cc., a daughter was born on January 8, the morning of the annual meeting of the Philadelphia Wholesale Lumber Dealers' Association. The tiny visitor will bear the name of Mary Elizabeth Matthews Williams.

Jerome H. Sheip of the Jerome H. Sheip Company, Inc., says last year was a distinctly successful one in their cigar box lumber business. The company contemplates increasing its timber holdings, in which case it may resume the bardwood lumber business.

Gucker Brothers is a new firm which has succeeded to the business of the estate of Jesse Roberts, Chestnut Hill.

D. S. Bunting & Co., Chester, Pa., are in the receiver's hands. Isaiah Bunting of this concern was appointed receiver. The business is capitalized at \$100,000, of which \$76,000 is issued. Assets are placed at \$45,000; liabilities, \$40,000.

Beecher & Barr, Pottsville, Pa., have begun to manufacture mountain hardwood at Fairdale, Va., and expect to be ready to market some excellent stock in the spring.

The Kendall Lumber Company, Pittsburgh, has reopened a Philadelphia branch office, which will be in charge of Otto C. Cluss, formerly secretary and treasurer of the W. R. Taylor Lumber Company and later with Charles F. Felin & Co. Office at 539 Real Estate Trust building.

The Edward F. Henson Lumber Company has submitted plans for the converting of its two piers, 37 and 38 North wharves, Delaware river, into one large pier 240 by 550 feet, to cost \$75,000. The electric hoisting system will be installed for the handling of the lumber. This concern is making every preparation for a magnified business which is sure to follow the opening of the Panama canal.

to a more central location. The plant will be open within the next sixty days

For the past week one of the country's largest operators in the veneer and hardwood lumber business have been negotiating in Little Rock with a view of constructor, a same manufacturing plant in Little Rock. That some kind of a venery and woodworking plant will be constructed here in the near future is sure. Among the men who have taken part in these negotiations are Geo. Frost, president of the Frost Vencer and Seating Company, New York City; Chas. E. Maley of Yazoo City, Miss.; John A Thompson of Edinburgh, Ind.; Martin Cutsinger, who has been engaged in the vencer and hardwood manufacture in Edinburgh, Ind., and Indianapolis, Ind.; Frank May of May Brothers of Memphis, Tenn., and Homer T. Cutsinger of the Cutsinger Veneer Company, Indianapolis, Ind.

The Homer I. Cutsinger Lumber & Veneer Company has recently closed a deal with the promoters of the Factoria addition to Little Rock to put an Shame Lardwood will be the new addition. Mr. Cutsing r comes to Little Rock from Edinburgh, Ind., and has associated with him F. D. Wise, W. L. Nebler, Ora Amis, Henry Wertz and Edward D. Zaiser, all of Indianapolis and Edinburgh. Offices have been secured in the Southern Trust building at Lattle Rock and plans for erecting the plant are now under

——— ≺ NEW YORK ≻=

Reports from the New York office of the West Virginia Pulp & Paper Company state that newspaper reports of the breaking of the dam at the company's plant at Luke, W. Va., were greatly exaggerated. The dam broke at a point where the water was very shallow, consequently reducing the pressure. And there was no mad rush of the waters of the reservoir, as reported, but a comparatively easy flow resembling more an ordinary spring freshet than a violent flood. There was no loss of life or serious injury to anyone.

John F. Dingee, formerly prominent in the mahogany and cedar trade of New York and a member of the firm of P. M. Dingee & Sons, died January 9 at his late residence in Brooklyn. He is survived by a widow and one daughter

Conrad N. Pitcher has again become associated with the Wright Lumber Company, hardwood retailers, of which Peter A. Smith is a principal. Mr. Pitcher has a number of warm friends in the local trade and all are glad to have him back. He left the lumber business about two years ago to engage in another line of activity. A new corporation known as Wright Lumber Company, Inc., has been formed, with Mr. Smith president and Mr. Pitcher secretary and treasurer.

The Blue Rock Manufacturing Company has opened an office at 17 Battery place, in charge of E. T. Carvin. The company has mills in Alabama and makes a specialty of oak, hewn and sawn. Headquarters of the company are at Mobile, where there are also adequate yard facilities. Mr. Carvin was formerly in the lumber department of the American Car & Foundry Company and also has acted as southern buyer for some New York wholesale houses

James McBride, hardwood flooring specialist, 139th street and Rider avenue, returned recently from a trip to the South.

E. Stringer Boggess, hardwood wholesaler and exporter of Clarksburg, W. Va., sailed from New York on January 10 for a two months' trip in Europe.

George Morgan of the W. S. Mercereau Lumber Company, Parkersburg, W. Va., manufacturer of hardwoods, was a recent visitor in New York. Cecil West was another Parkersburg traveler to visit the metropolis.

Other lumber visitors recently noted in town were Owen M. Bruner, R. B. Rayner and F. A. Dudley, all from the Quaker City.

---≺ BUFFALO >=

The decision of the National Hardwood Lumber Association to hold its annual convention in this city on June 18 and 19 is pleasing to the lumbermen. This convention is expected to be a very well attended one and the Buffalo hardwood men will do their best to afford excellent entertainment to visitors. The local hardwood dealers are hopeful that O. E. Yeager may be promoted from vice-president to president as a recognition of the able services he has rendered the association, and he will have the support of every local member of the trade for the higher office.

For the entertainment of the National Wholesale Lumber Dealers' Association, which is to meet here on March 4 and 5, President A. W. Kreinheder of the Buffalo Lumber Exchange has appointed the following commit-M. M. Wall, chairman; John McLeod, O. E. Yeager, C. Walter Betts, M. S. Burns, Hugh McLean and Henry I, George. The convention will be held at the Iroquois hotel, and an attendance of at least 500 is expected. The banquet will be open to the ladies and from 100 to 150 are expected to attend

A. J. Chestnut spent some time lately at his hardwood operations in New Hampshire and found trade in that direction to be better than it is

M. M. Wall and Peter McNeil are planning again on their annual winter vacation, which they are expecting to spend at Alden mineral springs, not far from this city. They will go toward the end of the month for two weeks' stay.

The Standard Hardwood Lumber Company is now getting in its large winter supplies of oak and chestnut from the Cumberland River section, and stock will be coming forward for two or three months.

High Mel, an has gone south for a scale commensuring which he planned to viset a number of mads and the method hardwood manufacturers' meeting at Memphis.

(i) E. Yeager has been respected as decomposition. Repulsican Club of this city. The yard is getting in each to be a distock of some maps proper will ask.

Blakeslee, Perrin & Darling report business picking up this month, and good business is expected this year. Last year's business turned out a mate satisfactory volume.

James A White of the National Liu, a Company has been spending some time in Michigan lately, looking after limber interests. The demand for flooring is said by the commany to be improving.

The Cutting Furniture Company, an old concern manufacturing bedroom furniture and specialties, with factory on Clinton street, is withdrawing from business and selling out at retail.

Miller, Sturm & Miller state that trade has shown considerable improvement since January 1. The yard is now receiving stocks of maple, chestnut and other woods.

Homer T. Kerr differs from most of the members of the hemlock trade by calling it very good. He says he can sell it all readily as fast as tecung tit. He is a cively engaged in introducing soft maple into the trade.

=< PITTSBURGH >=

The Muthal Lumber Company reports excellent inquiries for hardwood and some very nice business going around. Some of these from railroads and big manufacturing concerns have already been placed.

I. F. Balsley is now in charge of the business of the Balsley & McCracken Company, as D. M. McCracken, who is a well known machinery man, has withdrawn from the lumber end of the business. Mr. Balsley recently booked some very nice business from the East.

The marriage is announced of A. Adelman, president of the Adelman Lumber Company, and Miss Lilian Adelman of New Jersey. The happy event took place January 4 and the couple is now living on Squirrel Hill. The Adelman company has added to its force of salesmen H. R. Grannis and Charles H. Stein, both experienced lumbermen who will work Ohio.

J. N. Woollett, president of the Aberdeen Lumber Company, is bringing up a big barce of cypress this week which will be unloaded at Mississippi river points for general distribution. He recently spent three weeks among the southern and southwestern mills.

the southern and southwestern mills.

The Mountain Orchard Lumber Company of Pittsburgh has been organized by W. G. Hughes, W. A. Clay, William G. Humphrey, J. K. McKelvey and Thomas Glass of this city, and has applied for a Pennsylvania charter.

and Thomas Glass of this city, and has applied for a Pennsylvania charter.

Among encouraging announcements in this district are new plants to
be built as follows:

The Allegheny Steel Company will spend \$175,000 for a new plant at Brackenridge, Pa.

The West Penn Steel Company will spend about \$175,000 for a new plant at the same point.

The American Stamping & Enameling Company of Bellaire, O., is arrang-

ing to build a \$250,000 plant at Massillon, O.

The American Sheet & Tin Plate Company is taking bids on a plant

40x184 feet at New Kensington, Pa.

The Structural Tube & Steel Works is arranging to build a \$75,000 plant at Greenville, Ps.

The firm of C. E. Breitwieser & Co. is extending its mill connections and adding to its salesmen. A. G. Breitwieser of this concern reports fine business in sight and believes this year will be much better than 1913.

The Kendall Lumber Company announces through its sales manager, G. M. Chambers that business is starting off in first-class form. It had a splendid lot of sales last week and these were well distributed among manufacturing and industrial concerns, indicating a general good buying solifit.

The Western Lumber Company, according to President W. W. Wilson, Jr., is very optimistic in regard to business this spring. Inquiries are already appearing which make it evident that the bulk of buying will be considerably increased within the next few weeks.

E. V. Babcock of E. V. Babcock & Co. is one of the leading men in the campaign to secure a \$3,090,000 endowment for the University of Pittsburgh, He has already contributed \$21,000.

The Pittsburgh Chamber of Commerce is making strenuous efforts to secure for this city one of the new regional banks of Issue. A big delegation presented Pittsburgh's claims at Washington last week.

—— ≺ BALTIMORE >=

Fire broke out from some unknown cause in the lumber yard of Helfrich & Sons, Columbia avenue and Bayard street, on January 16. The loss, which is fully covered by insurance, was confined to relatively small figures.

The stockholders of the West Side Lumber Company of Hagerstown, Md., at a meeting held January 15, elected the following directors: Solomon George, C. A. Gardner, T. F. Phreaner, Isaac V. Moore, Riebard Hartle and John Stockslager. The directors met later and elected these officers: President, Richard Hartle; vice-president, I. V. Moore; secretary, P. S. Lane, Jr.; treasurer, Solomon George, who is also general manager; assistant manager, C. A. Gardner.

According to information received here from Lynchburg, Va., the Leftwich Timber Company, which owns thousands of acres of timberland and timber rights in Nelson county, Virginia, is arranging to begin milling Harris Manufacturing Company Johnson City, Tennessee

OHIO VENEER COMPANY

Mahogany and Circassian Lumber & Veneers

¶ The largest assortment of finest figured Mahogany Logs, Lumber and Veneers in the country can be found at the Chicago plant of C. L. Willey.

¶ We are just in receipt of fifteen cars of remarkably superior Circassian Walnut Logs, large size, well-figured and of good color, which are now being cut into Veneers.

¶ A visit or correspondence from discriminating buyers of all varieties of fine Imported and Domestic Cabinet Woods in Lumber and Veneer is solicited.

¶ You will not only find the Willey ware-houses well stocked with a superb collection of Circassian, Mahogany, Vermilion, Black Walnut and other fancy foreign and domestic lumber and veneers, but buyers are assured of prompt and painstaking service, and a quality of product not usually obtainable.

To visit the plant take Blue Island Ave. car at the postoffice to Robey Street.

C. L. WILLEY, Chicago

Largest Fancy Wood Veneer and Lumber producing plant in the world

operations in a hort time. The company has just secured an amendment to its charter whereby its capital stock is increased from \$10,000 to \$300,000. One of the first phases of the development is to be the construction of a railroad from the Southern into the tract.

The well-known lumber firm of T. J. Shryock & Co., which has for years occupied the wharf and yard property on Philpot street, just at the bend, has moved to the place formerly occupied by Thomas A. Charshee & Bro, on South Caroline street, where a lumber shed has been erected and other improvements have been made.

──≺ COLUMBUS ≻=

Malcolm Jennings was elected secretary of the Ohlo Manufacturers' Association by the executive committee of that organization, to succeed Opha Moore, who resigned a short time ago.

Extensive additions to its yard space have been planned by the Edwards Lumber Company of Cincinnati, O. The company has just leased for a period of five years the entire block between Eighth, Horne, Seventh and Garrard avenue, making a yard 200 by 500 feet in extent.

Benjamin W. Putnam, aged seventy-nine years, founder of the Putnam-Hooker Company of Cincinnati and father of Harry B. Putnam, a lumber dealer of Columbus, died suddenly of heart trouble recently.

Claiming that there are millions of acres of land in the state which would give a greater return devoted to forestry than to any other purpose, members of the Ohio State Forestry Society, who held their tenth annual meeting at Columbus recently, adopted a resolution to the effect "that the Ohio State Forestry Society does request and urge the general assembly at its next regular session to enact a law which will be broad in scope and of general application to the forestry interests of the state."

The annual meeting of the stockholders of the Marion Lumber Company of Marion was held recently. Reports of the work last year were heard and proved very satisfactory. Directors and officers were elected.

The Bucyrus Lumber Company of Bucyrus, O., was organized recently. It is officered by Jacob Colter, president; P. J. Carroll, vice-president; C. J. Scroggs, secretary; W. A. Bilcke, treasurer; S. S. White, general manager, and Peter Conkle, assistant manager. Operations will begin at once. The Voltrath mill property was taken over by the company.

The John S. Oram Company of Cleveland has been incorporated with a capital stock of \$60,000 to engage in the cooperage business. The incorporators are W. H. Keim, Oscar T. Oram, William Clark, E. J. Oram and Edward J. Kovanda.

Fred Bower, who had been in the sawmill business in Risingsun, O., for the last forty-three years, closed his business recently because of old age, he being over eighty years of age. When he started in the business the mill was located on the Whitman property, and in 1883 it was rebuilt on the present site. Since then the mill has been enlarged several times.

R. B. Lovell & Co., who recently opened offices and wholesale yards on Dublin avenue, Columbus, report a very satisfactory business and are going into the manufacture of West Virginia hardwoods, in which they are specializing, on a large scale at an early date.

B. M. Freeman was elected president of the Columbus Builders & Traders' Exchange at the annual meeting held January 5. R. L. Watson was elected first vice-president and W. H. Beckett second vice-president. The exchange endorsed the plan of the Columbus Manufacturers & Jobbers' Association to hold a Columbus-made exposition for the week beginning June S. An invitation was received personally from J. M. Vollner, secretary of the Louisville Builders' Exchange, to attend the meeting of the national organization at that city January 20-22.

R. W. Horton of the W. M. Ritter Lumber Company, Columbus, O., reports an increase in the volume of business in all varieties of hardwoods. He says there is a good movement and shipments are coming out promptly. Prices are holding up well and strength is shown on all sides. Yard stocks are still short in most places. Mr. Horton recently returned from a business trip in the Buffalo territory.

A. C. Davis of the A. C. Davis Lumber Company says trade in hard-woods is holding up well and prices are fairly firm under the circumstances. At Newark, H. O. Norris has admitted Frank C. Webb as a partner, and the business is now Norris & Webb.

The Clay Tie & Lumber Company of Chillicothe has been incorporated with a capital stock of \$5,000 to deal in lumber of all kinds and railroad ties. The incorporators are Harvey Clay, William R. Snyder, Lillian F. Snyder, Sallie Herrnstein and William Herrnstein.

The Gotshall Manufacturing Company of Toledo has increased its capital stock from \$60,000 to \$250,000. The company has included in the corporation its factory located at Archbold, O., and the lumber plant of C. W. Woeman at Vickery, O. The company has a large plant at Elyria.

Because of the appropriation last year of \$2,000,000 for new buildings at state institutions, State Auditor Donahey stated a large saving in architects fees could be made if the office of state architect were created. He computed that in the last five years Frank L. Packard of Columbus, who has been employed as architect for most of the state buildings, has drawn \$125,000 in fees, and other architects have been paid \$130,000.

Charles Tudor Williams, vice-president and general manager of the Cleveland Box Company of Cleveland, died at his home January 7.

Columbus contractors are protesting vigorously against the state liability rates applied by the Industrial Commission, and have asked that the Columbus Builders & Traders' Exchange appoint a committee to make an investigation. It is complained that the charges in many instances exceed the rates of the liability insurance companies. The new schedule

which contractors are compelled to pay under the workmen's compensation law is as follows: Carpenters, generally, \$2.30 per \$100 pay roll; carpenters, interior, \$1.40; carpenters, residence, \$2; brick masons, \$2.70; stone masons, \$2.70; concrete construction, reinforced, \$4; concrete construction, \$3; concrete pavements, \$1.20; painters, outside, \$2; painters, inside, \$1.40; plumbers, \$1.40; electricians, \$1.40; and roofers, \$3. It is protested by contractors that they must pay \$2.70 for stone masons, the same as brick masons. This is held to be unjustly high

J. A. Ford of the Imperial Lumber Company of Columbus says there is a slight improvement in the demand for hardwoods in this section, and prices are generally well maintained.

C. H. Holden, a manufacturer and jobber of Parkersburg, W. Va., visited Columbus jobbers recently.

J. W. Mayhew, general sales manager of the W. M. Ritter Lumber Company, left for Battle Creek, Mich., in an effort to regain his health, which has been bad for some time.

John R. Gobey of John R. Gobey & Co. reports a fairly good demand for hardwoods in this territory, with prices well maintained,

Secretary David S. Benbow of the Sowers-Leach Lumber Company of Columbus has purchased the stock of the former sales manager, W. B. Sissors, who has left to start in the commission lumber business in Columbus. Mr. Sissons will be at the head of a line of retail yards in Ohio.

=< INDIANAPOLIS **>**=

The Indiana Veneer & Lumber Company is preparing to rebuild, at a cost of \$30,060, its lumber plant which burned recently.

An order for \$13,000 worth of furniture to be used in the new supreme court building at Santiago, Chile, has been received by the L. W. Ott Manufacturing Company.

The Broad Ripple Lumber Company, located at Broad Ripple for many years, has just incorporated its business with an authorized capitalization of \$25,000.

A company to manufacture furniture and hardwood specialties has been organized at Mount Vernon and incorporated with \$60,000 capital stock. Directors and principal stockholders are W. A. McGregor, E. F. McGregor and E. R. Phillips. The concern is the McGregor-Phillips Manufacturing Company.

The Indiana Hardwood Flooring Company has brought suit for \$10,000 damages against the Indianapolis Traction & Terminal Company. The plaintiff's plant burned October 25 and during the fire a street car ran over and cut the only available line of fire hose. The suit is the first of its kind ever brought here.

School children in all parts of the state have been asked by the Indiana State Board of Forestry to participate in a forestry essay contest, to close May 1. Cash prizes will be awarded for the best essays relating to forestry influences.

James Lunny of Covington, Ind., timber buyer and stave manufacturer, dled suddenly at his home in that city on January 11. He was seventy years old and was born in Ontario, Canada. Two children survive,

E. C. Atkins & Co. are being visited by M. Cahne of Paris, France, one of the company's European representatives. M. Cahne, who has been coming to the city fifteen years, says the voyage was the roughest in his experience.

---**≺** MEMPHIS **≻**=

S. B. Anderson, president of the Anderson-Tully Company, has sent a check for \$50 to the firemen's relief fund in token of the appreciation of himself and associates of the excelient work done by the fire department at the fire which recently destroyed about 400,000 feet of lumber belonging to this firm. The fire originated on Sunday, when practically all the workmen were away, and did about \$15,000 damage. The prompt response of the department saved a spread of the flames to the plants and other holdings of the company, and thereby relieved the danger of a general conflagration in the North Memphis lumber district. The fire has not interfered in any way with the operations of the Anderson-Tully Company, which is engaged in the manufacture of hardwood lumber, box shooks and veneers.

The veneer plant of Nickey Brothers & Bass, in the northeastern part of the city, is nearly ready for operation. The Nickey Brothers Hardwood Lumber Company has operated a big band mill in that section of the city for several years, but some time ago it was decided to install veneer machinery to be run in connection therewith. At that time the Nickey interests took Walt G. Bass into the firm and the installation of the vencer machinery has been under his personal direction. There are four machines and one slicer. For the present the veneer machinery will be worked principally on white oak and red gum, but the management states that other fancy woods will be used later. The machinery is new and up-to-date in every respect. Mr. Bass will have entire charge of the veneer department. He was at one time connected with the Memphis Veneer & Lumber Company and brings to his new position a wide experience in the manufacture and distribution of veneers.

J. W. Wheeler & Co., with mill at Madison, Ark., have opened sales offices in the Randolph building, in charge of William Pritchard, who, as recently announced in Hardwood Record, has purchased the interest of H. L. Wheeler and the estate of J. W. Wheeler & Co. in this firm. The new offices in the Memphis Trust building will soon be ready for occupancy and will be used then. C. L. Wheeler, the partner of Mr. Pritchard

THE GLUE THAT IS APPLIED COLD -

In Flush Veneered Doors

The chief consideration is uniformly highgrade glue. Manufacturers of this modern type of door realize that its development has been retarded because the unavoidable lack of uniformity in other types of glue makes it impossible to know how long a door will stay in condition. The

Of vegetable glue insures absolute uniformity because of the very nature of preparing it and because every pound of our raw material is rigidly inspected.

Vegetable Glue

Is also a rigid and permanent adherent; will not blister in sanding; has no disagreeable odor; will not deteriorate in standing-for a week if necessary; and can be applied cold without any heating application of any kind in the glue room. In addition, the average saving over former glue bills has been twenty per cent where vegetable glue is used.

A DOOR MAKER SAYS:

..... McCleary, Wash., 9/30/13.

Perkins Glue Co., South Bend, Indiana.

Dear Sirs:—It is now about a year since we added a veneer door department to our operations. Deciding on the glue which would give the best results, we con-sidered the most important matter in connection with this new department.

Investigation convinced us that your product was the one we wanted in order to turn out the most dependable doors and panels and it has been gratifying to find that it has given us low cost as well as superior quality.

Yours truly,

Yours truly,

GJO-BB CHEHALIS FIR DOOR CO. By Geo. J. Osgood.

Perkins Glue Company

Originators and Patentees

805 J. M. S. Building, South Bend, Indiana

THE GLUE THAT RUNS ABSOLUTELY UNIFORM

in this business, with in the his headquarters at Madison and will have

of the magnificturing end of the busine S. B. Anderson, president of the Anderson Tully Company, is one of a committee of three to superintend the work of installing a levee system that will protect North Memphis from overflow during high water in the Mississippi and Woll rivers. Judge A. C. Floyd and L. M. Stratton are the other two members. The last legislature authorized a bond issue of \$500,000 for this purpose and the proceeds of this will be used to defray

the expenses incident to the construction of the levees. The North Memphis district is noted for its many lumber and woodworking enterprises

and this movement is regarded as of vital interest to them.

The big hardwood mill of George C. Brown & Co. at Proctor, Ark., is closed down, as are also the plants operated by the Mark H. Brown Lumber Company at Mounds, Ark., and J. H. Bonner & Son at Heth, Ark. These companies have taken this action because they wished to reduce their stocks before another flood made its appearance in the Mississippi, They suffered considerable loss during the visitations of 1912 and 1913 and say that they do not expect to carry as large stocks as they had on hand during the spring of both of those years. George C. Brown & Co. are taking advantage of the cessation of operations to make extensive repairs, and they will later install a resaw. The Mark H. Brown Lumber Company has been closed down since December 20 and it is expected that it will resume operations some time this week. Steps are being taken, as noted in HARDWOOD RECORD recently, to strengthen and standardize the levees in charge of the St. Francis Levee Board, but the lumbermen having extensive interests in that territory are taking precautionary measures against carrying big stocks that may be subject to damage by high water.

The Goodlander Robertson Lumber Company has taken a lease on new yards closer to the South Memphis lumber district and will begin storing lumber thereon immediately. Later the offices will be removed thereto from their present location. The new yards are expected to greatly facili-

tate the company in the handling of its business.

The band mill of the Gayoso Lumber Company in New South Memphis has been about completed and is practically in readiness for operation. This company several years ago bought a considerable amount of timber in Tunica county, Mississippi, and for a time brought this to Memphis and had it cut by custom mills. It decided several months ago to install a mill of its own and purchased the machinery from a firm in Mississippi. Although the mill bad been used somewhat, it is as good as new and will cut 40,000 to 50,000 feet per day. W. A. and C. R. Ransom are the principal holders of the Gayoso Lumber Company.

The Bradley Lumber Company has recently been granted a charter under the laws of Arkansas. It is located at Warren and has a capital

stock of \$25,000

The Arkansas Lumber Company has been organized at Arkadelphia, Ark., and is now getting ready for business. It is capitalized at \$10,000,

N. V., H. L. and V. H. Wright are the incorporators.

The Southern Hardwood Lumber Company has been launched at Decatur, Ala. James W. Adair is president, E. W. Himes is vice-president and general manager, and R. M. Lipscomb is secretary-treasurer. The company is engaged in the manufacture and wholesale handling of both southern hardwoods and yellow pine. All of the officers of the firm have had a wide experience in the lumber business. Mr. Adair will have charge of the sales department, while Mr. Himes will look after the shipping end of the business.

Weather conditions since the first of the year have been practically ideal for logging operations, and good progress is reported in this work. There has been very little rain since the new year opened, and the movement of timber is fairly full. The receipts by river, however, are comparatively small because the water is so low that rafting is out of the question and towing is effected with more than usual difficulty. Practically all of the mills here are well supplied with timber at present, but it is recognized that weather conditions during the next few weeks will play an important part in determining whether or not there will be an adequate supply of raw material for the plants here and elsewhere in this territory.

=≺ NASHVILLE **>**=

The Dimension Lumber Company of Haywood county, with an authorized capital stock of \$5,000, has been incorporated by F. J. Nunn, W. S. Elder, R. W. Haywood, J. W. Byrn and Currey Dixon.

The Southern Woodenware Company, Nashville, with authorized capital stock of \$50,000, has been incorporated by D. W. Cantrell, J. J. Johnson, J. W. Mason, J. W. Hare and Wm. Hume, Jr. Mr. Cantrell will be president, and Mr. Mason general manager. The company will manufacture woodenware

W. R. Howard of Hopkinsville, Ky., has purchased a tract of 500 acres of timberland on Crab Orchard creek, near Deermont, Tenn., and will

have a sawmill built to develop the land. The Cumberland Stave & Heading Company, which has operated a big

plant at Livingston, Tenn., will move to Harriman, Tenn. The company will increase its capital stock, making the total \$25,000 preferred and \$50,000 common. The company has had a payroll of \$5,000 monthly at Livingston, and the plan is to have a much larger plant.

A. B. Ransom, S. Lieberman and several other prominent Nashville lumbermen have been in Memphis this week attending the meeting of the Hardwood Manufacturers' Association of the United States.

An important change was made in the Nashville trade recently. J. W. Boyd retired from the firm of Love, Boyd & Co., and that firm will be continued by J. W. and Hamilton Level and rathe same name. the dissolution of partnership J. W. Beyd & co. was organized and incorporated with authorized capital of 82,000 by J. W. Boyd, C. E. Mc Glocklin Wenderl McFadden, W. R. Horn orckle and W. L. Pierce, and will perfect plans to start business in or early date. Love Boyd & On are moons the large hardwood open to som the local held

The Morford Lumber Company wit a has operated plant in West Nashville, has been incorporated with authorized capital stock of \$10,000, by Chas M. Morford, J. M. Whitson, W. N. Bryant, K. H. Dodson, F. C. Tower Mr Morford, nead of the company is president of the Nashville

The election of L. B. Pennock, head of the Rock City Handle Company, as president of the Association of Spoke Manufacturers of the United States, at the recent convention in Memphis, was very gratifying to his many friends in Nashville. Mr. Pennock is one of the leading local manufacturers, and has had long experience in the busines

The Nashville Hardwood Flooring Company is having installed four boilers of 150-horse-power each. The plant will be closed down until February 1, while the boilers are being installed.

Charlton L. McConnell, general manager of the Nashville Hardwood Flooring Company, and one of the best-known men in this section in the hardwood manufacturing business, died January 17 at his home in this city. Mr. McConnell was forty-seven years old, and suffered a nervous breakdown a short time ago. He had held the position ten years, pre-vious to which time he had been with the Prewitt-Spurr Manufacturing Company. He was a native of Virginia, and is survived by his widow and three daughters.

Oscar M. Davidson, aged thirty-one years, died at his home in Denver, Colo. He was president of the Standard Manufacturing Company there. The deceased was a son of W. V. Davidson, president of the Davidson, Hicks & Greene Company of this city. The tuneral and interment took place here. Mr. Davidson leaves a widow

===≺ LOUISVILLE ≻===

Louisville hardwood men have been busy recently taking in the various meetings of interest to them. A considerable delegation was on hand last week at the annual of the Indina Hardwood Manufacturers' Association, these including T. M. Brown, W. P. Brown & Sons Lumber Company: S. R. Cecil, Booker-Cecil Company: R. F. Smith, Ohio River Sawmill Company: D. E. Kline, Louisville Veneer Mills; and E. S. Shippen, Louisville Point Lumber Company. A good crowd also went down to Memphis this week to attend the Hardwood Manufacturers' Assoclation convention

Hardwood men are keeping a weather eye on the legislature, which is now in session at Frankfort. It is likely that the current session will be one of the most important held in many years. The enactment of a workmen's compensation law is probably the chief matter of interest, the lines having been drawn by the labor organizations' bill, which provides for state insurance, makes the system compulsory, fixes a rate of indemnity much higher than the average, and in general is radical from the standpoint of the manufacturers. The Kentucky Manufacturers & Shippers' Association, representing the lumber and other business interests, has had a bill introduced which provides for fixing the awards by the circuit judge of each county where the accident happens; makes the scale of indemnity less than the labor bill, but up the average of other state measures; does not provide for state insurance, and makes the system optional. An unfavorable feature of the situation is that the coal operators are anxiously urging the adoption of a state insurance feature, in order to provide cheaner and more inclusive insurance than they now have, and they are likely to throw their support, which is worth much politically, to the labor bill in order to get the kind of measure they want.

Edward S. Shippen, head of the Louisville Point Lumber Company, is a pearl collector of note. This avocation keeps him amused while on logbuying expeditions up and down the Ohio river.

The Edw. L. Davis Lumber Company will probably make arrangements with the Ford Motor Company to turn over part of its yard, which has been purchased by the company as an assembling plant, before the expiration of the lumbermen's lease, which has some time to run.

Selling expeditions have been numerous on the part of members of the local trade. R. F. Smith, P. G. Booker, E. G. Stemmelen, J. G. Brown and others have been on the road seeking the clusive orders. As a matter of fact, however, all of them report that the situation looks a lot better than it did thirty years ago, and all of the concerns are expecting to handle a good volume of business from now on

C. C. Mengel, vice-president of the C. C. Mengel & Bro. Company, has been re-elected a member of the board of directors of the Board of Trade,

which held its annual meeting recently.

A new lumber road is to be built by the Tug River & Kentucky Railroad Company, a Norfolk & Western subsidiary, from Tug river, in Pike county, up Poplar, Peters and Blackberry creeks to connect with the Norfolk & Western in West Virginia.

The Ben F. Hawn Lumber Company has been organized at Pincville, Ky., by Ben F. Hawn and others with a capital stock of \$15,000. The company will probably operate a sawmill.

Mat Dempley has acquired the sawmill which heretofore has been operated at Crestwood, Ky., by the firm of Jacob Dempley & Son.

The growth of the wood-preserving business is graphically indicated by

Walnut for Export

Thirty years' experience in the handling of walnut logs for export enables me to furnish guaranteed prime quality stock.

I am constantly in close personal touch with the source of supply of export walnut logs and know exactly what I am getting at all times. In fact, a number of the best foreign houses are taking up my logs on my own recommendation.

My supply enables me to fill orders of any size in carload lots without delay.

Highly Figured Walnut

As a result of close personal supervision of log purchases my stock of highly figured wal-nut in long wood and stumps contains only the choicest in figure and curl that can be found.

All this stock is carefully selected to take care of a discriminating demand.

My figured stumps are all dressed closely and when shipped are practically in shape for the knife

Youwill lose nothing by trying me on your next inquiry.

> FRANK PURCELL = Kansas City, Mo., U.S.A.

THE QUALITY OF YOUR VENEERS

Your profits depend largely on economical production, and uniformly cut veneers lessen the cost of production.

Our employes are experienced, our machinery modern, and we use the best selected logs in Mahogany, Circassian Walnut and Quartered Oak.

Therefore, we will furnish you with absolutely uniform and bone dry sliced or sawed veneers that your men can handle with a minimum outlay of time and labor.

This Means Money in Your Pocket

We will welcome you to our plant (which is so modern it's worth coming to see) or we will send a representative with samples, on request.

plans which have been announced by the American Creosoting Company, which has offices in Louisville, for the construction of a creosote plant at Woodward. Ala—The company will establish a plant in connection with coke evens which are now in operation, and will make creosote and other conf-tar products, thus getting the material which it uses in its fourteen plants. The company is one of the largest concerns in the wood-preserving industry and uses an immense amount of material.

Lumbermen do not appear to understand the motive back of a bill which has been introduced in the state legislature, the purpose of which is to repeal the act creating the state board of forestry. The board, through the state forester, J. E. Barton, has done excellent work, a recent report showing that during the past autumn fires which destroyed 350,000 board feet of fimber were put out by the county fire wardens appointed by the department. The loss would unquestionably have been much greater without their assistance.

----> WISCONSIN ≺=

The Middleton Lumber Company of Ripon has been incorporated with \$45,000 capital. G. J. Middleton, F. T. Chittenden and J. A. Middleton are the incorporators.

The Lincoln Box Company of Merrill has been incorporated by Charles F. Hackbart, J. G. Wenzel and George Misterek.

The Eagle River Lumber Company of Eagle River has been incorporated to manufacture and sell lumber and other timber products. The capital stock is \$12,000 and the incorporators are Fred W. Behn, Theodore A. Brenner, Henry Leppla and Herman F. Behn.

The Westfield and Fall River Lumber Company of Mosinee has filed an amendment to its articles of incorporation increasing its capital from \$15,000 to \$150,000.

The Paine Lumber Company and other Oshkosh lumbering concerns, which have been closed for improvements, overhauling and repairs, will soon be running full force. The Paine concern will resume operations in its entire plant after a long idleness. The H. McMillen, the Foster-Lothman and the Gould mills have already resumed operations. Hundreds of unemployed have been supplied with work. The Diamond Match Company has awarded a contract to the Coddington Engineering Company of Milwaukee to erect a large fire proof addition, four stories high and 65 by 110 feet in size.

The E. W. Ellis Lumber Company, Grand Rapids, has commenced its season's cut and expects to soon begin both day and night shifts. The first shipment received by this concern was thirty cars of hardwood logs, arriving at Grand Rapids Saturday, January 17. It is expected this season's cut will exceed that of last year.

The work of making repairs in the Connor sawmill at Stratford has been completed. About fifteen million feet of logs will be cut the coming season.

The Neillsville Cheese Box Manufacturing Company has closed up its business at Neillsville, having sold its business to Blum Brothers, of Marshfield, who will enlarge their factory at Marshfield and conduct the entire business in that city. The Neillsville plant is closed.

The Great Northern Pail Company, whose plant was destroyed by fire recently at Gillett, will replace the old plant with a modern structure, 100 by 80 feet in size, which is to cost \$15,000. The plant included an electric plant which supplied the village. Joseph H. Murphy is president; H. C. Sorenson, vice-president; W. W. Smith, manager. The general offices, formerly located at Green Bay, will be removed to Gillett.

Work has been commenced at the new woodworking plant of L. S. Barber & Sons at Butternut. The concern will manufacture broomhandles but will cut table leg squares for a period, for which product all such lumber that cannot be used for broom handles is used.

The Hannahs Manufacturing Company of Kenosha has made plans to double its capacity by several large additions. Excavation work has been started on a machine room, to be one story and 85 by 120 feet. Adjoining it will be four new dry kilns, each 18 by 120 feet. A new power plant will change from steam to electric drive. A glue room for veneering will be two stories and 60 by 220 feet. A warehouse will also be erected, two stories and 60 by 122 feet. The new dry kilns will give the concern a capacity of 40,000 feet of dry lumber daily.

The Tomahawk Veneer & Box Company, which was incorporated in September, 1913, has commenced operations. The concern purchased the No. 2 saw and planing mills of the Bradley company, taking possession on November 1, and the planing mill has been remodeled to meet requirements in producing veneer and cheese boxes. Max Meyer is manager of the plant, which has produced its first product. Rheinhard Meyer is president; W. H. McDermott, treasurer; George L. Sladek, secretary; Julius Gromoll, vice-president.

As a memorial to their father, the late William Carson, a pioneer lumberman of Eau Claire, the daughters of the lumberman, Mrs. James McIntire and Mrs. Theodore K. Long of Chicago, Mrs. Jocelyn McGrath and Mrs. C. W. Lockwood, Eau Claire, have purchased from the Eugene Shaw estate Half Moon Lake Island, one of the beauty spots of the city, comprising 135 acres, and presented it to the city of Eau Claire. It will be known as Carson Park.

The Haevers Logging Company of Green Bay has erected a mill in the woods at the source of the timber supply and will haul the cut lumber from the mill to the shores of Green Bay to be marketed by boats and railroads in the spring. This method has been adopted by the Haevers

company to solve the problem of signification accomparatively low cost this winter despite the fact that there is attacsnow in the woods. concern has about two million feet of timber in the vicinity of Egg Harbor and the cutting of it has commenced. Fifteen teams of horses with wagons are used to bring the times to the mill and hard the lumber to the dock at the bay shore,

The Kellogg Lumber Company of Antigo started five sprinklers on January 12 to see its logging toads. A, the 12th the low 1 imperature is highly favorable there is little snow to keep the water from running off the roads, which have become heaved and uneven. No attempt would be made to make ice roads under these conditions but the horses must be worked to keep them in condition. Work is being provided for laborers until logging is going ahead in full swing.

Seventeen million feet of lumber, almost entirely hardwood, will be sawed at Antico sawmills this year. The Faust Lumber Company, which does no logging but buys all its logs, will cut 8,000,000 feet into lumber at the Antigo mill. These logs are coming from points on the Mattoon railway, the vicinity of Bowler, on the Heineman and Elton branches of the Northwestern road and from north of Monico. Unless there is a heavy snowfall "caterpillar" locomotives will be used to haul trains of

hugh sleighs over ice roads.

A cut in wages of the men employed in various capacities of the lumbering industry is reported from northern Wisconsin and Michigan. At the Big Lake Siding logging camp the announcement resulted in a general walkout, only the foreman, cook and blacksmith remaining. duction of about ten per cent was announced by Marinette and Menominee companies, to take effect this month.

The Barker & Stewart Lumber Company of Wausau has denied the liability of the loss caused by the carrying away of the Leahy & Beebe bridge during the 1912 floods. It is alleged that the lumber company bad logs in the river above the bridge which, when carried against the ice jam, forced the bridge out of position. The bill for repairs was sent to the concern by the common council but was returned unpaid.

The Rapid Washing Machine Company of Grand Rapids has been formed to manufacture a revolving bottom and suction plunger washing machine, the invention of William Wittee of Ripon. The company, with \$10,000 capital, has leased the former Anderson Carriage Works for a factory and has employed Gustave Keye, who has been conducting a spindle carving works on Upper Second street, as manager.

That the Wisconsin labor market is congested is shown by the report issued by the Wisconsin Free Employment bureau. During December of 1912 there were 115 applicants for every 100 positions, while December, 1913, showed 238 applicants for every 100 jobs. Milwaukee showed 256 applicants for every 100 jobs, while Superior reported 130. Unemployment is greater among factory girls and women who work by the The employment offices obtained positions for 1,683 in December of 1913, as compared to 1,587 for same period the year previous. The total number of men applying for positions last year was about 18,000, of which about sixty per cent secured employment through the offices.

The Wausau Log & Land Company has completed most of the cottages planned for erection at Malvern, where a sawmill is to be erected in spring. The mill will consist of a gang mill and band re-saw. lumber will be loaded onto cars direct from the mill and piled at Wausau where it will be run through an edger and trimmer and cut into lengths for box manufacture after seasoning. The firm expects at least ten years' operations at Malvern.

The Hardwood Market

=**≺** CHICAGO **>**=

The first tint in the silver lining of the black cloud that has overhung the lumber business locally for some little time is just making its appear-While it has taken almost a month for this long-promised improvement to materialize since the first of the year, this fact has not been any particular disappointment to the trade, as it was not expected that consuming factories would begin to replenish their supplies until it became entirely evident that there would be no general break in lumber prices and that business conditions affecting them directly would show somewhat of an improvement. The steadying down of the business element all over the country has injected more life into all merchandising transactions and the result is a strengthened market for various products. In fact the furniture exhibits at Grand Rapids and Chicago are really developing a very satisfactory line of sales and this fact, coupled with a real shortage of stock which exists in consumers' hands, has started the ball rolling. It is not only hoped but expected that the improvement in sales conditions as far as the hardwood business is concerned will be gradual, but is nevertheless anticipated that it will be consistent and real.

The much more favorable condition of the money market has loosened up capital that will go into building investment, which promises to materially assist in strengthening the local lumber situation. In fact without exception all lines of the consuming industry are feeling the improvement, which is reflected in the increased inquiry for hardwood stocks. It is not as yet a fact that prices have been materially improved, but that

Start Somewhere

No proposition can be accurately figured out unless a starting point is first established.

Did you ever encounter a man who professed that he was entirely satisfied with his lumber kiln drying results?

Will not even the expert tell you that occasionally his lumber comes through his kiln just right—the next time it is too green—the next time it is too dry—the next time that it is checked, warped or honeycombed?

There is a reason for it.

Usually it is not the fault of the dry kiln.

How can it be expected that woods of various texture, various thickness or at various stages of air dryness can be subjected in a kiln to the same heat, the same ventilation, the same duration of time and accomplish uniformly satisfactory results?

It is an impossible proposition.

START SOMEWHERE.

Start with lumber that is uniform in texture and dryness through and through.

The solution of all lumber-drying difficulties is the employment of

Kraetzer-cure

TRADE MARK

This is lumber treated with steam under pressure in the Kraetzer Patented Preparator.

Lumber that has been treated in this apparatus is fit for the kiln, whether it be 30 days old, 60 days old, or six months old; is delivered without check, split, stain, warp or other seasoning defects, and is of an uniform and mellow texture and color.

This lumber can be satisfactorily kiln-dried in the simplest form of a kiln in one-third of the time that ordinary air-dried lumber requires.

The kiln will deliver this lumber as it received it, save for dryness.

Its milling qualities will be vastly improved, as also its strength and elasticity.

The big loss in shrinkage will be avoided.

Furniture or interior finish made of Kraetzer-cured, kiln-dried wood will hold its glue joints, stay where it is put, and the shrinkage and swelling, even under violent atmospheric changes, is almost nil.

It will take filler and even water stains without per-

ceptible raising of the grain.

We will cheerfully supply the names and addresses of all lumber manufacturers who employ the Kraetzer Preparator, naming the kinds of woods they produce.

Buy one car of steam treated lumber, handle it through your kilns and into your finished product, and you will be convinced that you cannot afford not to use Kraetzer-cured lumber.

The same desirable results can be achieved on ordinary air-dried lumber with a Preparator as an adjunct to your dry kiln.

The Kraetzer Company 537 S. Dearborn St., CHICAGO

that condition is anticipated is vouched for by most of the local trade. On the whole the basiness situation in Chicago, as far as lumber is conceimed really promises well, and it seems evident that it will not be long octors those promises are fulfilled.

— ≺ NEW YORK >—

The improvement in market conditions which has been so long expected seems to be on its way, for there are noted some concrete examples of a trade revival. The volume is larger, and while most of the business is for mixed lots indicating a hesitancy on the part of buyers to give orders to stocking up, there are some instances where time delivery orders are being placed. The stocks of lumber on hand at local yards and manufactories are small and badly broken, and no doubt the next thirty days will witness some future buying. It may be noted here that a fair volume of this character of trade will give firmness to the market if it does not advance prices. On the whole the price situation may be called satisfactory, and in some cases as in the better grades of ash, there are slight advances. Chestmit and goin are the weakest items in the present market

=≺ BUFFALO >=

The hardwood market has improved this month, and most yards are midding a pretty fair demand, considering the season. A more confident feeling is now prevailing and wholesalers are expecting the improvement to continue and become more pronounced within a short time. New stock is coming in right along, and some yards will be handling a large amount of new lumber within the next month or two, much of it from the South. Lower yard prices are prevailing in some woods, but the majority of hardwoods are being maintained on a pretty firm level.

Plain white oak is in rather abundant supply, and this is causing a weakness in price, running as much as 50 cents per thousand. Some yards are said to be making lower prices than usual in order to reduce their large supplies of this wood. Maple and birch are in fair demand and are holding firm in price. In veneers the prevailing demand nowadays seems to be for birch. Chestnut is moving quite well. Basswood is rather plentiful, while clin in some grades is scarcer.

— < PITTSBURGH >-----

The new year is breaking away with excellent prospects for good business ahead. Inquiries are more numerous, orders are a little more plentiful, industrial activities are much more in evidence, and priess of lumber are going higher. All these factors indicate a return of good business, and especially of safe and same methods of handling the lumber trade. Wholesalers are putting out many new men and making better connections at the mills, indicating their confidence in the hardwood business for 1914. The Pittsburgh district is rapidly recovering in an industrial way. Resumption is the password all along the line. Inquiries from the big concerns in this district are beginning to come in, showing that they are going to be ready buyers of lumber this year. For this reason wholesalers are much encouraged and are getting ready to go after business this year in a strong manner.

------≺ COLUMBUS >=

Quite an improvement in the hardwood trade has been noted in Columbus since the first of the year. With the completion of their semi-annual inventories dealers are buying more liberally. The inventories disclosed the fact that stocks were low and that they must replenish them. Prices are pretty well maintained at the levels which have prevailed for some time. Another feature of the trade is the better buying on the part of certain factories. Implement and vehicle concerns are buying fairly well, and some demand is expected from furniture factories when the semi-annual shows are over. Reports seem to Indicate that the furniture shows are being successful.

Preparations are being made for an active building season in the spring, as architects and builders are busy on plans and specifications. Despite the general business depression, the feeling in lumber circles is good. Dry stocks of hardwoods are not very large, which is taken as a good indication. Stocks in the hands of retailers are very small. Railroads are now handling shipments promptly, as the car supply is adequate. Collections are not the best.

Quartered oak is firm and the movement is fair. The same is true of plain oak. Poplar is moving better and prices are firm. Chestnut is another strong point in the market. Basswood and ash are in fair demand and other hardwoods are unchanged.

=≺ BALTIMORE >===

The past two weeks have brought no important changes in the hardwood trade, it being still too soon after the beginning of the year for any quickening influences to make themselves impressively fett. That the situation is stronger, however, appears to admit of no doubt. Even though prices have not advanced and the movement is yet very much restricted, decidedly more confidence prevails in the future, and the hardwood trade lives in anticipation of what may be looked for in the near future. Already signs of an expansion in the movement are to be noted, and if it has not assumed more pronounced shape this is perhaps due to the open winter, which allows no fears of a shortage to come up. The mills continue operations with practically no interruption, and there are no

formulable remediments in the way of 2 day stocks to the publicads. Orders are being not with a freer normal of promptness, and the output is relatively large for this scassor of the year. The years and other layers, on the other land, are disposed to maintest greater freedom in entering into communicates; in the first place, occause the outbook is more bassuring and, seconday, for the reason that their holding back for some weeks has resulted in material reductions in the supplies, which must be replicated of it the selections are to be adequate.

No change in the quotations is to be noted. Low grades of chestnut and poplar are still case, with exten wide peptar almost in a state of suspension as far as movement case. But no further recession is to be recorded, and here and there signs are observed which encourage the hope that values, even in the least active of the stocks or those in most liberal supply, will move up before long. Oak in the various grades is holding its own quite well, and the interest shown in the offerings of the sellers since the first of the year is of a grafffying character. All of the stocks in general use are being called for, and the movement seems to be expanding. The export business is still affected more or less by the unfavorable conditions that have influenced certain features of it, supplies in the United Kingdom being too free, while in some continental countries the buying capacity is impair d because of internal conditions; but the out-look is recarded as merceasingly bright

=≺ CINCINNATI ≻=

There is a decided improvement in the hardwood field and although the actual booking of orders is as yet small, all of the good prespect signs are displayed and it is believed the expected change for the better will make its appearance early. Prices on all items remain firm and many inquiries are received covering the whole list. Factory trade is expected to be in full blast in a few weeks at the most, and as it is a known fact that there is little stock in the hands of consumers, there is bound to be a very good general demand for hardwoods when business gets in full swine.

The furniture and implement trade is said to be in a fair way for a nice business and they are expected to be big consumers. The labor troubles in this section appear to have been settled, the strikes of last year which burt business so badly were so disastrous to organized labor and the manufacturers' organizations that were formed at that time to handle the situation, have been so thoroughly maintained and are in a fair way to remain permanent that labor leaders will be very careful this year in starting any trouble, having failed last season and lost their prestige among the rank and file.

Designs expect that there will be a good steady demand the coming season and know that stocks are low in the hands of consumers but they also are of the opinion that they will be expected to carry the stock for some time to come, that is to say, that buyers will not likely stock up as they used to do but will order stock as needed but orders are expected to come with much more frequency than during the latter part of last long as quick shipments on railroads are possible and that will likely be for some time but a little congestion on the railroads will channe this quickly.

— ≺ INDIANAPOLIS >=

The hardwood trade has been more or less listless for the last two weeks. There have been some inquiries for spring deliveries, but no current sales of note. Prices are about the same as they have been for weeks, and there is little buying except to meet immediate needs.

There is nothing particularly discouraging about the present situation. Indications point toward a reasonable amount of spring business which will come through a resumption of industries over Indiana as well as a renewal of building operations. Many modern business buildings which will require interior hardwood trim are to be erected in Indianapolis.

----≺ MEMPHIS >-

The hardwood market shows some improvement since the first of the year. There have been more inquiries and some of these have resulted in actual business, so that shipments are now on a somewhat larger scale. The export situation has shown little if any improvement, and leading exporters here are prepared to expect reasonably quiet conditions in that division of the market, for the reasons outlined in the Memphis correspondence of Hardwood Record two weeks ago. There is a fairly active demand for red and white oak in both the higher and lower grades, and prices are pretty well maintained. There is likewise a pretty fair demand for the higher grades of sap gum, though prices are if anything a shade lower. The upper grades of red gum are not moving in a very satisfactory manner. The demand appears to be rather limited, while the supply at the moment seems to be in excess of the call therefor. The lower grades of both cottonwood and gum are still selling with considerable freedom, but prices in some quarters are reported a shade easier. Ash is well maintained and deliveries of this lumber are being made at pretty full quotations. The demand is good. There is comparatively little call for cottonwood in firsts and seconds and in box boards, and prices are lower to sell, The trade is rather optimistic regarding the outlook. Due emphasis is being laid on the improving business conditions throughout the country, and lumber interests believe that this better general situation must sooner or later reflect in increasing activity for lumber. There is more building in progress now than for a long while, and the movement the rallroads

No. 1 & No. 2 Com. Cypress						40,000				

*Indicates stock dry enough to ship within 60 days; remainder of items ready for immediate shipment. The item of Core Stock is a special grade, suitable for veneering over. This is thoroughly dry and we are prepared to quote an attractive price.

All Red and Sap Gum in grades of No. 1 Common and Better is Kraetzer-Cured, insuring the lumber to remain straight and flat and to be absolutely free from stain. Kraetzer-Cured Lumber is of a soft, mild texture and uniform color.

We have facilities for kiln-drying and surfacing. We specialize on Oak timbers, switch and crossities, car stock, bridge and crossing plank.

VIEW OF MILL SKIDWAY, WITH PART OF LOGS STORED IN BACKGROUND-WE HAVE 6,000,000 FEET OF SELECTED HARDWOOD LOGS STORED ON OUR MILL YARD.

have launched looking to higher rates is regarded as a possible bullish factor.

=≺ NASHVILLE >=

Business rules quiet in the hardwood market. Many of the dealers have been taking inventories, and closed up the year in a satisfactory The hardwood business in the Nashville market is estimated at \$8,000,000 to \$10,000,000 annually, and reports of dealers indicate that 1913 business was as large as that of 1912. They are fairly well stocked at present, supplies being about up to the average. Some business is being handled in oak, ash, poplar, chestnut and other lines, and while values are not as strong as they were six months ago, most dealers are not inclined to make concessions

==< LOUISVILLE >=

Though the railroads are not buying at all, according to hardwood concerns which specialize in that trade, and though purchases by furniture manufacturers have been light on account of the shows still being on, sentiment, which is the most important factor in creating trade conditions, has improved materially during the past few weeks. Inquiries are more numerous and new business is being booked. While the volume of trade being handled is not exceptionally large, it is sufficient to show that consumers are getting their stride and that the use of hardwoods is proceeding at such a rate that users will have to resume buying in order to keep pace with their factory operations. Contracts have been made for deliveries during 1914, and in most cases advances in the prices have been recorded. Contract buyers are also specifying deliveries, so that apparently the actual cutting up of lumber is going forward steadily. The interior finish situation is also good, and the prospects in that direction are more favorable than they have been for months. Altogether, lumbermen feel encouraged and are getting ready to make 1914 a good year.

==≺ *ARKANSAS* >=

Though no material advances have been made in the hardwood market of Arkansas during the past two weeks, the manufacturers of hardwood throughout the state are entertaining great hopes for the future. The Hardwood men are almost universally optimistic over the outlook for the present year. The indications are that 1914 will prove a prosperous year in all lines, and the lumbermen in general expect better market conditions. For the past several weeks the market on most items has been decidedly low, scarcely no market being had for staves and heading. The manufacturers of these last mentioned items are however continuing to operate, and are storing their products for future sales. market for oak of the various grades continues to show unusual strength, this being practically the only hardwood item for which there is much demand at present.

───≺ MILWAUKEE **>**=

The hardwood market is beginning to show more activity, and wholesalers are confident that a better business may be expected from now on. While orders are still coming in rather slowly, more inquiries are being made daily. Retailers about the state are beginning to think of getting their stocks up in readiness for the spring trade, while the factory consuming trade is evincing more interest. The realization that stocks in first and second hands are unusually low and the fear that prices will go higher, just as soon as the spring rush sets in, seems to have awakened buyers that now is the time to place their orders. Wholesalers are urging that buyers get in their orders as soon as possible, while there are dry stocks available, while shipping facilities are of the best, and before further advances are experienced.

The mild weather, decidedly unfavorable to logging operations is causing considerable concern to the lumber interests. A short period of cold weather and a slight fall of snow was received in the northern lumber country recently, but the weather turned warm again and logging operations are being impeded seriously. Loggers and lumber concerns have a large cut of logs lying in the woods, as camps all over the lumber country were opened early last fall, but except in special instances, it has been a difficult matter to haul and skid the logs, so that shipments to the mills have been curtailed. The lumber business was fairly good last season and stocks were decreased in most instances. It was generally conceded that the logging output would be large this winter, but it now begins to look as though the cut would be smaller than usual. This will surely mean a shortage of dry stocks and higher prices before the spring building rush is over with.

Building operations in Milwaukee have been showing activity during January, a natural result of the mild weather. Up to and including January 17, the amount represented by permits issued aggregated \$232,-458, as compared with an investment of \$130,231 during the corresponding period of 1913. Permits will be placed soon for several structures. ranging in cost from \$100,000 to \$300,000 each, while architects have completed plans for the erection of the theatre, hotel and office structure which will be started early next summer on the site now occupied by the Plankington house, and representing an investment of \$4,000,000.

Birch and maple are in leading demand among the northern hardwoods, while stocks in the hands of manufacturers are said to be light. Plain oak seems to be the leader in southern woods. Box manufacturers seem to be meeting with a rather slow business, which is curtailing the demand for low-grade hardwood.

WHY?

WHY do more than 380 of the most prominent and successful lumber manufacturers exchange nearly \$30,000,000.00 of indemnity against fire loss at

Manufacturing Lumbermen's Underwriters

BECAUSE!

BECAUSE it is the oldest and strongest inter-insurance association among lumbermen, being now in its fifteenth year.

BECAUSE \$978,432.40 cash savings have been returned to members.

BECAUSE \$856,831.32 cash surplus, owned entirely by the members, has been accumulated.

BECAUSE \$2,443,029.00 has been paid in losses under prompt and equitable adjustments without resort to quibbling or technical controversy.

BECAUSE it was the first to settle lumber losses on a market value basis.

BECAUSE the regular, frequent and thorough inspections given the plants of all members help them to prevent fires, thus materially reducing both the fire waste and the cost of indemnity.

Box 95, Hardwood Record

GIBSON TALLY BOOK

This three-throw tally ticket cover is made from aluminum, and accommodates four tally tickets—4½x8½ inches in size.

Folds compactly to less than one-fourth inch in thickness and fits side or inside coat pocket. Gives large area of four tickets for complicated tallies, or straight grade can be made on one page.

Accommodates any form of tally ticket desired.

Special, patented, triplicate tally tickets supplied, printed on waterproof paper with carbon backs. Tallies made on these tickets are unalterable. Their use enables the inspector to retain triplicate, and forward original and duplicate. Duplicate designed to be attached to invoice.

These tally books are perfection for durability-covenience, accuracy, and for systematizing the inspection and measurement of lumber

Patent applied for on covers. Copyrighted, 1910. Triplicate Tally Tickets patented.

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.
VENEER AND SAWMILL, BIRCHWOOD. WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak. We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

Custom Mill Work, Storage, Inspection

ON

Foreign Fancy Woods, Mahogany, Cedar, Circassian

We receive the logs, store or warehouse them, manufacture them into lumber, cut or saw veneers, pile and store the product, and ship via any railroad. Also furnish inspection returns on logs or lumber. Can furnish accommodations and economies which it is impossible to secure elsewhere. We always have on our yards parcels of plain and figured African, Mexican and Cuban Mahogany, Circassian Walnut and Cedar logs, placed here for sale by direct foreign shippers, from which advantageous purchases can be made.

Astoria Veneer Mills & Dock Co.

Long Island City, New York

Veneers and Panels with a Reputation

WE manufacture Veneers in all the native woods and for all purposes. Also Built-up Panels in native and foreign woods—three and five-ply—and have established a reputation for furnishing high-grade material. Send us your inquiries and orders and become one of our satisfied customers.

OUR DOUBLE BAND MILL-HUTTIG ARK

Why We Can Give "Value Received"

We own one hundred thousand acres of the best virgin
Southern Hardwood timber.

We operate large band mills at Huttig, Ark., and Deering, Mo.

We cut FORTY MILLION feet of hardwoods annually and carry 15,000,000 feet IN STOCK.

We sell only stock cut on our own mills and so can GUAR-ANTEE the quality of EVERY shipment.

We ship high grades that increase the size and percentage of your cuttings, reduce factory costs and shrink the waste pile. Therefore:

We can SAVE YOU MONEY on every shipment of oak, ash, gum, elm, cypress, tupelo, hickory, cottonwood, sycamore, soft maple and dimension.

A floor to adore

For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "inequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our poilshed surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free

Newest Hoosier Band Saw Mill

We have been building band mills for thirtyfive years and this New Hoosier Band Saw Mill represents the experience of these years.

The simplest mill in construction and the easiest kept in order.

We build this mill in three sizes, 6, 7 and 8 ft. The widest saw the 6 ft. mill will carry is 10"; the 7 and 8 ft. mills will carry 10, 11 or 12" saws. This mill is built in a substantial manner and embodies all that is latest and best in Band Mill design. The base is of the heavy extension pattern and is so constructed

that it does not overhang the foundation but extends completely around the mill. By means of the construction of the column the upper wheel runs in the center of the mill and is supported both above and below the mandrel. The bearings are long and are chain oiling.

The tension device has roller bearings and is very sensitive and durable. The upper guide is raised and lowered by power and is nonbreakable. The lower guide is so arranged that it can be opened quickly. The roll back of the saw is power driven.

The 6 ft. mill will split a 48" log and lay down a 30" board between saw and column; the 7 ft. will split a 54" log and lay down a 36" board, the 8 ft. will split a 57" log and lay down a 42" board.

Place Your Contracts Here

Leading consumers have learned the advantages of buying their lumber on contract, making agreements with reliable houses covering their year's supply, and then specifying deliveries as the material is needed.

This method has many advantages, chief among them being absolute protection against unexpected rises in the market, shortages of stock and the like; while the lumberman, knowing in advance the requirements of his customers, is in a position to provide for them and to extend service which is not always possible with single-car orders.

We are not endeavoring to convert present one-car buyers into contract-makers; but the point we would like to impress is that with reputable manufacturers at one end of an agreement, and Louisville hardwood houses at the other, absolute satisfaction and delivery of lumber as agreed are assured.

Review and Outlook

General Market Conditions

CONSIDERING THE COUNTRY AS A WHOLE, a continually strengthening note of optimism has been apparent in hardwood circles in the last two weeks. From everywhere reports are emanating which indicate greater activity of inquiry, larger individual sales and a real strengthening in values. This can be ascribed only to a more favorable condition of trade among purchasers of hardwood stocks generally and a more apparent confidence in the business future of the country during the coming year. As is usually the case when any transition of trade is taking place, reports are rather mixed and even from the same territories are divergent,—that is, as one prominent Philadelphian expresses it, some fellows are still blowing out the candle just to see if it is dark,—but as a general thing the usual desire seems to be to throw on the electric current and make it even brighter.

All lines of trade are evidently feeling a substantial strengthening in business. Favorable reports of railroad purchases are not at all uncommon, which condition is probably partly due to considerable confidence in the outcome of the freight rate agitation and also in the condition of freight movement in general. With the easing up of the money situation, building operations have taken on a different aspect and the call from this class of the consuming trade is much more satisfactory than it has been. This applies to general building construction material as well as to finish and woods which go into other more advanced phases of building construction. The furniture people took a favorable view of recent furniture expositions, although they stated they were not overwhelmed with orders. They are, however, favorably impressed with the possibility of business during the next few months. The implement people are feeling a good demand as is usually the case at this time of the year and are buying nicely. The box trade is holding up in excellent shape and is responsible for a certain strengthening in certain grades of hardwoods.

A feature of the business which is probably not as it should be is the actual delivery of oak. It is reported that orders for this class of stock are plentiful, but that in many instances deliveries are being delayed without apparent reason, that the territory in which this is most evident, however, is rather restricted and it is not anticipated that it will have any general effect on the market. As a result there has been some little tendency to shade oak prices on the part of concerns whose sales are principally in the territory affected. On a general basis, however, oak is not available in unduly large quantities and its price is holding firm in quartered and plain.

In red gum nothing of particular importance is noted as this wood continues to go along on about the same plane as it has been moving.

Saps, however, are in stronger demand, particularly in the box grades, as is cottonwood in the same grades, the box manufacturers having been taking large quantities of these woods. Furniture men are also using considerable sap gum, which is helping the situation materially.

As a general thing it is probably a fact that the northern woods are in a little better position than the southern woods, although it cannot be said that either class of material is not doing nicely. It will probably be a fact that in Wisconsin the input of logs will be about twenty-five per cent below normal; the prediction of which condition is already having its effect upon the general market. Some substantial sales have already been made in northern woods at very favorable prices, particularly favorable as compared to last year's values.

No distinct developments can be seen in the export market, which continues in a rather unfavorable light, particularly from southern ports. Eastern exporters are probably a little more favorable in their expressions of the foreign situation than are southern exporters. They seem to see real evidence of the probability of a better condition of freight rates for foreign shipments, which will enable American lumbermen to compete more successfully with foreign woods of certain character. It is reported in some cases that stocks abroad are fairly well cleaned out and the resulting condition would naturally be favorable to American shippers. Apparently there is nothing in the situation which can prevent a really good trade during the year 1914, with prospect of good business conditions generally, with stocks at the mills in good shape or, where they are rather long, in strong hands with consumers' stocks and yard stocks in short condition on an average. Of course it is impossible to foretell all developments in the future, but it is significant that some of the most sagacious and successful wholesalers are purchasing considerable quantities of lumber to take care of the anticipated year's trade. This should serve as a pretty fair indication of what business will be during the next eleven months.

Eagle Creek Valley

T HE FRONT COVER ILLUSTRATION of this issue represents a forest scene in Eagle Creek Valley, western North Carolina. The stream here shown flows into the Little Tennessee river at Fontana. The valley has a length of fifteen miles and a breadth of ten, and is heavily timbered with hardwoods with a scattered growth of needleleaf trees. The most important of the hardwoods are yellow poplar, oak, chestnut, and white ash. The even and splendid stand of these trees has elicited admiration from all who have visited the region. Practically the entire valley or basin of Eagle creek is owned by the Montvale Lumber Company, which

is add by the fire R. C. Wood Lumber Company of Baltimore, Md. The laurel occupies its usual place as the fringe along the brawling brook, where it is an ornament and a nuisance at the same time. It is ornamental in the highest degree during the few days when it is in full bloom, and in a less degree the rest of the year. It becomes a disagreeable encumbrance for persons who attempt to follow the banks of the brooks where it grows. The tangled masses are well-nigh impenetrable until the axmen and path-makers have gone ahead. The experienced woodsman who is under the necessity of following a stream like that in the picture, prefers the boulders and the water to the pathless banks covered with tangled rhododendron. It is easier to wade the water of the brook than crawl over or under the laurel on the banks. Such boulders are usually covered with green algae, as slippery as grease, and the man who follows the brook's bed must be quick and careful if he does not get enough dippings at the base of boulders to make him a "hardshell Baptist" before the close of the day

Those who posses creative fancy can exercise it on this exquisite picture. They can people the woods back from the rivulet, if they like; or they can busy their imaginations with the two woods men who have, apparently, flung themselves on the bank to rest after a long wade in the water or a wearisome scramble through the laurel on the margin. One of them probably thinks he sees an easier way and is pointing in the direction; but the disconsolate attitude of the other indicates that he has his doubts. Or, if some other interpretation seems more reasonable, explain the situation in some other way. The forest scenes among the southern mountains are so rich in suggestions that the man has a poor imagination who can not evolve an interpretation to suit whatever mood he happens to be in.

An Evolution in Logging

THERE IS MORE TO BE SEEN in the active interest which is being manifested in the improvement and establishment of uniformity in logging operations in different parts of the country than the mere desire on the part of logging superintendents to make better records for themselves. Of course, that desire is the main inspiration of this getting together, but if the ideas as suggested are carried out and the proposed saving effected the cause of conservation will unquestionably be advanced materially.

It may be a broad step from the housing of lumber jacks or the more satisfactorily filling their inner cavities with substantial food on the one hand to the big question of conservation on the other; but nevertheless the close consideration of the various factors which enter into the modern logging operation for the purpose of reducing the general cost of getting logs to the mills will mean saving so much to the operator, and hence enabling him to work up his poor timber more closely than he could if he were paying more for this work. The effort is unquestionably justified from the mere point of view of economy, but it is doubly justified when the consideration is borne in mind. That the agitation is not merely transitory is certainly evidenced by the manner in which the various conventions during the last few months have taken hold of the subject. The manufacturers' association meeting at Memphis a couple of weeks ago definitely endorsed the idea, while the Northern Hemlock and Hardwood Manufacturers' Association, through its logging committee, has worked out a very valuable formula which will unquestionably do a great deal toward unifying methods and cutting logging costs. The frequent gatherings of logging superintendents will go a long way toward working this proposition out to a satisfactory basis and it is sincerely to be hoped that due progress will be made.

Famous Forest School Closes

THE BILTMORE FOREST SCHOOL has closed its doors forever. At any rate, that seems at present to be the situation. Dr. C. A. Schenck, the founder and head of the school, announced from Darmstadt, Germany, under date of January 1, 1914, that he will not continue the school, nor return to America, except occasionally as a visitor. The announcement was accompanied by his reasons for the step he has taken. His chief reason is that the school has not lately been a financial success. The number of students has been too small to pay the expenses of the school. The latest enrollment was only twenty, while there is no profit in an enrollment of less than forty.

Dr. Schenck's conclusion may be accepted on that point, but many will not agree with him in his second reason for the discouragement which he feels. He expresses disappointment with the success which his graduates have achieved. He either expected too much, or he has not kept track of those who have gone into the business world from his school. They have won their way in competition with forestry students from eighty-three other schools of this country, and they fill places in many lines of work, and do it with credit and honor.

Dr. Schenck, for his own encouragement, should recall Plato's decision when he was tempted to quit his school. He had only one pupil, and after looking along the empty benches—out of doors in the rain—he said: "As long as I have one pupil, I will go on." That lone pupil was Aristotle. Dr. Schenck may not have turned out any Aristotles from his school, but he may be sure that what he has done has been worth his effort, though his highest ambition may not have been realized.

He opened at Biltmore, N. C., the first forest school in the United States. He worked along lines different from other forest schools. Most of his work was done in the woods, in logging camps, and at sawmills. He aimed at the practical rather than the theoretical, or in his own words, he was not "preaching conservation, second growth, and theory." His ambition, quoting his words, was to have a "training school for the sons of every lumberman and every timber owner in the country. It was to be; it has not been."

During recent years he has spent part of his time with his students in the German forests, where European methods were studied, and part of the time in the woods of North Carolina, Michigan, and Oregon, where up-to-date lumbering practices were studied. The large amount of traveling made the school necessarily rather expensive for the students; but it was worth all it cost.

The probability is that the Biltmore school will not be taken up by any one else. It will occupy its place in the history of forestry in this country. It was a pioneer and blazed the trails. The presence of eighty-three other schools in the United States, in which more or less forestry is taught, is proof that the days of pioneering are past.

Spurious Mahogany

GENUINE MAHOGANY is probably the most useful of all cabinet woods. It is famous for its perfect seasoning, for the precise manner in which it stands after being placed in a finished piece of cabinet work, its gorgeous polish and the tone imparted to it with age. The supply is abundant and the price reasonable.

The extensive use of this most popular wood causes as a natural result the importation of other woods that do not possess the qualities of the true mahogany but which the importer hopes will by reason of somewhat similar appearance sell as a substitute for mahogany at a lower price. The entire trade suffers from this and it militates against genuine mahogany as the buyer of goods manufactured from such substitutes is usually under the impression that he is buying the genuine species and is eventually dissatisfied with the substitute, mahogany itself bearing the brunt of this criticism rather than this method of doing business, which is the real cause.

The importers of foreign woods and the good cabinet-makers of the country know that the best grades of mahogany, particularly for use by manufacturers of furniture, are derived from timber growing on the mainland from the province of Tabasco, Mexico, British Honduras, Nicaragua and Guatemala. There is also some fine mahogany found on the west coast of Africa, but of the "fifty-seven varieties" shipped from there as mahogany only two or three are genuine. At the present time considerable so-called Philippine mahogany is being

imported but while there are useful woods in the Philippines, no species of mahogany grows on the islands and it would seem that if manufacturers desire a substitute it would be just as feasible to utilize some of our native woods such as birch and gum, and stain them to imitate the genuine mahogany. This would result in a considerable saving over the utilization of the so-called Philippine mahogany. The reputable merchants in this line of business naturally, being merchants, sell what people want to buy; but it can be safely said that sales of so-called substitute mahogany are never made with out the buyer being told all that the seller knows about these woods. The buyers should protect themselves against the substitution of other woods, however, and give their orders to reputable concerns or insist upon samples being submitted so that they will know what they are to get. By pursuing this course disappointment to themselves will be prevented and a certain protection to the legitimate mahogany trade will be afforded.

Value of Exact Information

K NOWLEDGE IS POWER, and also money. There never was a time when there was closer connection between exact information and financial gain than there is now.

The industrial development of Germany within the past fifty years furnishes proof on a large scale that scientific education pays. Nobody guesses in Germany. No business man there experiments with his capital and his time. He hires an educated specialist to do the experiment-

ing. It is done in the laboratory. not in the factory. Every test is made, every trial is carried through, every theory is subjected to the most searching examination by men who are experts in those particular lines, but only on a small scale, and at as little expense as is consistent with thoroughness, until certainty is reached. Then the manufacturer begins with complete knowledge of what he can do, and he takes no risks. Success is certain.

That is in Germany, The profitable work shops, from center to circumference of that

country, afford proof of the wisdom of that method. Manufacturers become rich by utilizing what in America would be thrown away as waste, and all because experts have shown how to do it.

Most lines of manufacture in America are a long way from that degree of perfection. Too many take chances on a guess. That rule is not universal, but it prevails. Some of the largest oil companies and manufacturers of steel follow the German method, and know what they can do before they attempt to do it; and there are many others who employ thoroughly trained experts to test every process before it is undertaken on a large scale; but too many do not do so.

The lumber business, taken for the whole country, and in all departments from forest to factory, is probably in as much need of scientific investigation as any other great business in the land. One needs only to read the proceedings of lumber association meetings to be convinced that exact information is woefully lacking in many departments. Take a late convention of loggers, for example. One of the speakers had carried on investigations which showed that many logging operations are run without any definite information as to cost of the various steps in the process. Each follows a system of his own, which often is no system at all.

Another department which, according to reports of investigators, is based mostly on guesswork in many instances, is lumber camp economics, chief of which is the feeding and housing of the men and horses. Waste, inefficiency, and generally poor management could often be avoided by following the advice of an expert whose

special business it is to work out the various problems. The chief value of such service is due to the fact that details can be studied which would be out of the question for a general superintendent who has scores of other things to look after.

Another expensive guess, connected with milling operations, concerns the piling of lumber in the yard. This is only a detail, but it is worth looking into. Too often almost anything goes. The lumber piles may be so close together that free circulation of air between them is hindered; the boards in the pile may be placed jam up, edge to edge, so that air has no vertical movement; the Sticks may be too wide, thus unnecessarily covering much surface and thereby delaying the drying; and other things are wrongly done or left undone. Too many things are consigned to chance, where a due amount of precise information would eliminate expense and other undesirable results.

These are only instances of savings that might be secured, and where better work would result from better information. There are many others. In fact, they exist, or may be expected, everywhere along the road from the forest to and through the factory.

Some men think they know so much that the advice of a specialist is ignored. They are like a certain Pennsylvania oil operator who boasted that no expert could tell him anything. "The drill is my expert," was his favorite answer. "When it finds oil, I know the oil is there, and not till then." He drilled an \$8,000 hole at a guess, struck it dry, pulled his tools, and aban-

doned his lease. A geologist measured the dip of the region's strata, and figured that the drill had stopped within thirty feet of the oil sand. Acting on this expert's advice, another company put down a drill in the old hole and by boring twentytwo feet further struck a gusher.

That was an extreme case, perhaps, and was somewhat unusual; but it is an illustration of expensive guessing where precise information was within reach. Too many try experiments which never take them anywhere. They begin at a guess, and end in failure. Lum-

bermen ought to get away from the guessing game as speedily as possible; quit making expensive experiments; and get in the habit of trying out on a small scale before risking too much on a venture. Many have turned their backs upon the old way, let it be said to the credit of their business insight; but many go on guessing and experimenting on a scale entirely too large-go on feeding their camp men too much or too little; doing the same with their horses; logging at haphazard; piling lumber badly; roasting or case-hardening in kilns; and wasting valuable resources without knowing it. The advice of a specialist

UNSOLICITED TESTIMONIAL -

Established 1838

Edison's Doubtful Prophecy

is often the best-paving investment that can be made.

ON MATTERS CONNECTED WITH ELECTRICITY no one questions that Thomas A. Edison is high authority; but when the matter under discussion is wooden furniture, the value of his opinion as an expert is doubtful. He was recently quoted as saying that an absolute law is operating to substitute steel for wood in the making of furniture. He proceeds to explain that this law is the increasing cost of wood, and soon all furniture will be made of steel, since the steel required for a given piece of furniture costs only one-fifth as much as the wood will cost for the same piece. The next generation, he says, will not know what wooden furniture is.

It is easy to pick flaws with his conclusions, because they are not founded on facts. Unless steel shall be much cheaper in the next generation than it now is, or wood very much more expen-

sive than at present, Mr. Poison's figures are wild on the subject of mere cost. Good seasoned oak can now be bought for considerably less than two cents a pound, and weight for weight, steel now costs more when manufactured in shape for furniture making. Of course, steel may be rolled into sheets of any desired thinness, but cannot wood be cut into veneers as thin? In either case, there must be some sort of backing or braces to hold the sheets in place and give the piece of furniture the necessary rigidity. In case of wooden furniture this backing is made of cheap woods, while only the outer part is of expensive material. The interior braces required in metal furniture must add considerable weight, and consequently, add to the cost. It must be admitted that if a purchaser insists on pricing high-grade wooden furniture, and is satisfied with any sort of sheet metal substitute. the cost of the latter may be less than of the former; but if both kinds are to be high class, there is considerable doubt as to the higher cost of wooden furniture.

Mr. Edison depends upon "the increasing cost of wood" to bring his prophecy true. Wood will disappoint him. It will advance in cost as years go by, but not to the extent he seems to believe. The advance in cost will be partly or wholly offset by closer utilization and better methods of manufacture, so that a

given quantity of wood will go farther.

It is unsafe to put too much dependence in the predicted advance in cost of wood while taking for granted that steel will not advance also. Geologists have pointed out many a time that the easily-worked iron mines are not exhaustless. There are vast deposists of low grade ores, but improved methods of mining and reducing these must be waited for, or the price of iron will go up. Many people are exceedingly liberal with their prediction of wood's greater cost in the future, but they seem to forget that metals are likely to share in the advancing cost.

Mahogany, which is a widely used furniture wood, was about as expensive in this country 175 years ago as it is now.

Cost is only one of the things to consider in prophesying concerning the future use of wood in furniture making. Rest an hour some summer day on an iron bench in a park, and then try a wooden bench. The difference in favor of wood is so noticeable that iron benches are vacant and wooden benches all occupied, when both are alike convenient, and there are not enough people to fill all. Wood will have to go pretty high before iron chairs will find room in any civilized man's home. The same may be said of bureaus, dressers, tables, and many other articles of furniture. Wood is more comfortable wherever it is subjected to touch or contact; it is more handsome; more durable. Knocks which would scarcely mar a wooden cabinet would dent and damage one of sheet metal and make it unsightly ever after.

A New Light on the Rates Petition

THE PETITION OF FIFTY-TWO EASTERN RAIROADS that they be permitted to advance rates has met with new complications recently. An inquiry has been under way for some time, but its purpose was to find out whether the railroads are receiving enough revenue to meet expenses and provide a reasonable profit. The railroads contended that they were not, and they asked for permission to increase their rates in order to raise more revenue. The evidence submitted seemed, on its face, to substantiate the claims made by the roads.

Just as the necessity for more revenue appeared about to be proved, the Interstate Commerce Commission struck a new track. It was found that the railroads are not making the most of their present rates. They are performing too much free service where they have a right to make charges. They have done this for large shippers who are amply able to pay for the service. It may not be strictly correct to call these free services rebates, but they are in effect the same thing.

"No well informed persons," said Commissioner Harlan in a recent announcement, "can doubt that the discontinuance of these free services would save the carriers millions of dollars of expense annually, nor can any well informed person doubt that if such service should be measured in relation to its cost and its value and the general conditions surrounding it, and should then be made to contribute on a reasonable basis to the revenues of the carriers performing it the income of the carriers would be increased by many million dollars a year."

The commission has taken the stand that before the railroads can with justice ask for a general increase in rates they must first collect all the revenue possible under their present rates. In other words, they must not ask the public to pay more in order that free service to a few favored shippers may continue.

It is said that a discontinuance of such free service will save the railroads not less than \$15,000,000 a year. When that sum has been added to the revenues of the roads, it will then be time to ask the Interstate Commerce Commission for authority to increase the rates in order to make good any deficiency of revenue which can then be shown to exist. There will now be supplementary hearings to determine reasonable charges for such free service.

The trend of the investigation thus far has made it plain that the people generally are willing that the railroads should have rates high enough to produce fair returns on their investments; but, at the same time, the public has a right to insist that all shippers be treated alike. It is manifestly unfair to raise rates for the majority that special privileges be granted to a few.

A Worthy Effort

Hardwood record is in receipt of a communication and circular from a prominent hardwood manufacturing concern of Memphis in the interests of the Ransdell-Humphreys bill. It is very apparent that those situated or having interests in the vast Mississippi Delta country are doing everything within their power to stir up interest in this levee measure to secure its passage.

Disregarding entirely facts and figures regarding the importance of the project,-as the importance of some means of controlling the floods in this territory is pretty generally conceded,-it seems apparent on the face of it that it is possible to construct levees that would hold the river in control while it is passing through this country. It is simply a question of building these retaining walls of sufficient height and strength to overtop the water at its highest peak and to withstand the pressure at its greatest. That the plan is feasible is vouched for by the army engineers. If it is feasible it is certainly the simplest way of getting at it and, regardless of the value of any other suggestions or of the feasibility of any other plans, this offers an immediate means of checking the annual ravages of the Mississippi and it certainly seems worth trying out. It is apparent that if this plan is not adopted it will be a difficult job to arrive at a satisfactory decision regarding any other plan and it will be years before the question is even decided. Therefore, as stated, it looks as though this Ransdell-Humphreys bill should go through and that the vast Mississippi delta territory and its tremendous resources should be given an opportunity of full and unhampered development. The levees have demonstrated their ability to hold in certain places where they have been adequately and properly constructed. Is it not reasonable to suppose that they can hold as the general retaining walls of the river?

Advertising the Lumber Industry

THAT THE WEST COAST LUMBERMEN have seized an excellent opportunity of advertising the lumber business is shown in a report from the Pacifiic Coast Shippers' Association, stating that that organization has prepared a splendid lot of educational moving pictures, having now about 2,500 feet of films showing the lumber industry as operated on the Pacific coast from the stump to the car. These pictures are now being shown at twelve of the most prominent retail lumber dealers' associations' meetings throughout the country. Lecturers have been engaged to explain the pictures at these conventions and the opinions expressed by the various audiences have been to the effect that the entertainment is splendid. It will take two months to show the pictures at all the conventions slated, and after the convention season is over copies will be made and be shown on the regular motion picture circuits.

Pert, Pertinent and Impertinent

Quit Your Meanness

Put the hammer in the lacker,
Hide the sounding board likewise.
Any one can be a knocker;
Any one can criticise.
Cultivate a meaner winning.
Though it hurts your face to smilAnd seems awkward in beginning.
Be a hooster for awhile.

Just for solid satisfaction
Drop a kind word in the slot.
And I'll warrant you'll get action
on your effort on the spot.
And it isn't so distressing
If you give a little boost

To the man the fates are pressing.

When the chicks come home to roost

Yes, the old world would be prighter. If you'd kindle friendship's flame. And thus make the trouble lighter. Of the man against the game. Send your ground on a vacation, Give your grain ding tones the shake. And with grun determination.

THE BUSINESS SITUATION

See! There's a rift in the clouds-it's clearing up.

An Easy Solution

"How does the breakfast suit you, John?" inquired the young bride anxiously.

"It's just right, dearest," said her husband.
"It may be plebein, but I'm awfully fond of calves' liver for breakfast."

"So am I, dear," said the wife. "Oh, John, don't you think it would pay us to keep a caif? Then we could have liver every morning for breakfast."

Ingenious

A young lady took down the receiver of the telephone one day and discovered that the line was in use.

"I just put on a pan of beans for dinner,"

she heard one woman complacently informing another

She hung up the receiver and waited for the conversation to end. Upon returning to the telephone she found the women still talking. Three times she waited, and then at last, becoming exasperated, she broke into the conversation.

"Madam, I smell your beans burning," she announced crisply.

A horrified scream greeted the remark, and the young lady was able to put in her call.

Beating the Taxi

Man (at doctor's night bell): "Doctor, how much do you charge to go to the house?"

Doctor (calling through speaking tube): Two dodars."

Man: "All right; please come at once." (As they arrive in the doctor's automobile): "Here's your fee, doctor. A taxi would have cost twice as much."

Wrong Gender

A class in French at a co-ed college was orally translating a story about a cow from French into Engilsh. One girl persistently called the cow the" a number of times, until the professor stopped her short and said: "He is she, miss; we milk her in the next sentence."—Everybody's.

R R GOODMAN, GOODMAN, WIS., PRESI- J. T. PHILLIPS, GREEN BAY, WIS., VICE. GEORGE E. FOSTER, MELLEN, WIS., TREAS-

Meeting Northern Manufacturers

The annual meeting of the Northern Hemlock and Hardwood Manufacturers' Association took place as usual at the Hotel Pfister, Milwaukee, on Tuesday, January 27. Following the usual formal opening of the meeting, President Hamar read the following annual report:

Fresident's Address

I venture to say there has been more work done during the past year to arouse the lumberman, manufacturer, wholesaler and retailer through out the country to the needs of the business than any other one year period in the history of the industry. There are a large number of associations in the field. Most of them will hold meetings during these winter months, at which time they will grapple with the various problems connected with their branch of the business. To these associations we extend greetings. We wish them well and trust they will continue along in as friendly a way in the future as in the past, and we hope that the gettogether spirit that has prevailed to such a large extent during the year just ended will continue to grow and develop until the lumber associations have become one large organization working in harmony for the ultimate good of the cause. There seems to have been a recent awakening to the fundamental principle that in consolidation there is strength, Acting upon this knowledge, the National Lumber Manufacturers' Association sprang into life. Composed as it is of eleven affiliated organiza tions, it has under able management become probably the largest factor in working for the common good of the lumberman. Its officers have devoted time and energy to the problems facing them, your problems and my problems, and have in a quiet and business-like way, without any undue advertising or blast of trumpets, done the work of the organization in an efficient and able manner. When the National was first organized a number of us looked upon it as a fifth wheel. This illusion has been dispelled until at the present time most of us realize that it has its place in the field of association work. I would recommend that we continue to give it our moral and financial support.

Our own association has become, thanks to the efficient work of our secretary, a well-oiled, smoothly-running piece of machinery. During the past year the association, with a limited appropriation, has carried on a very effective advertising campaign. This advertising feature of our work we feel is beginning to bear fruit. I recommend that we continue this work and that an appropriation be made at this meeting for the coming year.

At the quarterly meeting at Eau Claire in October your officers were authorized to call a congress of logging superintendents to be held in Green Bay. This meeting was held during the early part of December and was largely attended. A number of papers pertaining to the industry were read, and much interest and discussion were aroused. I am confident that everyone who attended this meeting went away with some new thought. A committee was appointed by the chairman on welfare work in the logging camps. It was felt that by making eamps more sanitary and attractive a better class of woodsman could be secured. A committee on a system of logging cost was also appointed. It developed that nearly every company has a different method of figuring logging costs, while a great

many have no method at all excepting by using final figures at the close of the senson. The chairmen of these committees will have something to effer at this meeting. I would recommend that a logging congress for the benefit of our woods superintendents be held once a year.

The several meetings called for the lumber graders were largely attended and created considerable enthusiasm. A number of our members were somewhat skeptical as to the practicability of holding these meetings. I think, however, if they will talk with the different men who attended the meetings that they will become convinced that it was time and money well spent. The chance that it gave our graders to meet one another and the opportunity that it gave them to broaden their views were well worth while. I recommend that the bureau of grades be authorized to hold meetings of like character at least once a year.

In our zeal to log and manufacture at a minimum cost, I sometimes wonder if we give enough attention to that other part of our business known as the sales department. Anybody can sell lumber at some price, but to sell it and get the value for it requires years of training and ability. A salesman must go forth without samples and through his own personality sell his goods and get the price. The mill manager is so busy producing and trying to keep costs down so he can get an old dollar back for a new one, that he is apt to lose sight of the sales department as an avenue for increasing his revenue. He is inclined to think-"Well, we can get only so much for our lumber anyway." While we must admit we all have good men in charge of this department, still I think more attention should be given to that end of the business. It sometimes pays to back away from a proposition and get a broader view of it and what is beyond it. You may have expected too little, or gotten too little from this department. Keep your salesman keyed up to a point where the sale of lumber at a profit becomes a hobby; see that he talks and thinks lumber and that he feels he is selling the only stuff that is worth selling and worth buying.

Just now the railroads are struggling to get an advance in freight rates. believe this advance is to be five per cent, although we hear rumors that in certain instances they have discriminated against some commodities to the extent of five and even ten ner cent. I think that we should take a broad view of this subject and stand for an increase. True, there are gross discrepancies in our present tariffs, but there are those who feel that these can be adjusted satisfactorily later on. You might say that the railroads are suffering for their past sins, which is probably true, but as the prosperity of the country depends on the railroads are we not fellow sufferers? They have been compelled to increase wages of employes several times, put on safety equipment and improve rolling stock. To offset this drain they have increased the size of locomotives so as to increase the tonnage per train; but there is a limit to the size of a locomotive and a limit to the tonnage it can haul, and we have pretty nearly reached that limit. With gross earnings increasing, but with gross operating expenses increasing faster, so that net earnings are decreasing, is it any wonder that the railreads are looking for a way out? You may have your bumper crops, you may have your increase in merchandising, but you cannot have general prosperity when the railroads are not prosperous. This is especially true of the lumber and steel business, which are two of the mainstays of the country.

In a short time, no one knows gest when, the Panama canal will be open for traffic. What effect this is going to have on the lumber business. Is problematical. Far sighted whole-adies on the Atlantic coast are get ting ready to handle the West coast lumber which will curely more east ward as soon as the canel is open. Here we mything to car from this re-arrangement of the lumber traffic? It is estimated that there will be vessel capacity for only 200,000,000 the first year and that the rate will be between \$11 and \$12 per the said test. Add to this the cost of the lumber at shipping point, handling charges and freight from the Atlantic coast to the central states and year have the estimated selling price to the consumer. There are those who are inclined to think that hemlock manufacturers have nothing to fear from this quarter, while the influx of this lumber might be a distinct benefit by steadying the market which would do away with the extremes in prices that are so common and disastrous under present conditions.

At our send-annual meeting I called your attention to the acute resttessness in labor circles. This restlessness has been seized upon by Socialistic agitators who by falsehood and misrepresentation, have influenced the minds of men in different localities until at present some of our leading industries have very serious strikes on their hands. The papers of our large cities, ever anxious to cater to that part of man's make-up which craves for something sensational in the line of news, or through the influence of organized labor have not always represented the true conditions in these strike-infested districts. Conditions for the common laborer at present are bad; that is, we must consider them bad when men are out of work and being fed and housed at municipal expense. Most manufacturers are quick to take advantage of these conditions to reduce wages. I am not saying that wages should not be reduced in certain instances but I believe that it would be to the manufacturer's advantage () increase the efficiency of his plant rather than to take this step, for there is a living wage below which it is dangerous to go. Most of our freak legislation is brought about by just these conditions, labor hitting back at capital for a real or imaginary grievance. At this instant the Michigan Federation of Labor is agitating for an eight hour law in that state. A law of this sort would either increase pay rolls twenty per cent or it would reduce wages. If this law applied to the entire union it would probably hurt no one, as we would all be on the same footing. It would, however, increase the cost of living and we would continue to chase ourselves around a circle. I sometimes wonder if we have not reached the limit and if it is not about time for us to reverse and travel the circle in the opposite direction. We have liability laws which if equitable are just, but do we want an eight-hour law; do we want a minimum wage; do we want old-age pensions? All of these must be taken into consideration before you decide to reduce common laborers' wages below the amount which will support a man and his family decently.

Following the reading of the minutes of the previous meeting, Secretary Kellogg read the report of Treasurer George E. Foster. This report showed a balance on hand January 27, 1913, \$3,286.71; receipts during the year, \$20,908.14, making the total assets for the year \$24,194.83; disbursements, \$25,825.16, leaving a balance on hand January 26, 1914, \$3,369.69.

Secretary R. S. Kellogg then read his report, which as usual was full of valuable suggestions and was very closely followed.

Secretary's Report

It is a pleasure to report a prosperous condition of association affairs on the fourth anniversary of the amalgamation of the Northwestern Hemlock Manufacturers' Association with the Hardwood Lumber Manufacturers of Wisconsin, which marked the beginning of the Northern Hemlock and Hardwood Manufacturers' Association. You will find on the back of today's program the names of eighty-two members-two more than at this time last year, notwithstanding the loss of six members during 1913. Four of these completed operations and went out of business, one small firm dropped out because of reorganization and financial difficulties, while one larger firm terminated membership because it had too great an aversion to paying dues according to the membership contract, although it was very ready to take advantage of association activities. Altogether, we have a very compact, efficiently working membership who can be depended upon to do their part on the final show-down, although It sometimes requires rather strenuous effort on the part of the secretary to get the results be is instructed to do

The regular expenses of the association were \$150 less in 1913 than was estimated at the beginning of the year. In detail, they were as follows:

 Consequently, the not expenses were \$18,813,10. During the year a commodious safe cabinet for the protection of our records and a type-writer to help handle the increased correspondence were added to the office equipment, and also a small addressing machine to take care of the malling Bist. A small addition has also been made to the office quarters, so that we now have plenty of room and facilities with which to promptly handle a large volume of work. It may also be added that the actual amount of office work done in 1943 was very much in excess of that in any previous year, due chiefly to the heavy increase in correspondence because of association advertising.

A number of final reports of 1913 shipments have not yet been received. Consequently, no exact statement can be made of the present balance of association funds. If appears, however, that the balance will not be less than \$3,300, after deducting the appropriation of \$2,500 for the Forest Products Exposition, and advertising expenses on present contracts to the first of April the board of directors having authorized an increase of \$600 in the advertising appropriation over the amount allowed at the annual meeting last year. Our dues to the National Lumber Manufacturers' Association are also paid in advance until April 1. Considering these extin expenses, this approximate balance of \$5,300 compares most favorably with a balance of approximately \$4,000 a year ago, and of only \$400 two years ago. So far as can be determined at this time, the net over-run of dues on 1913 shipments will be about \$2,000.

The large statistical report which you have in your hands is altogether too long to be given detailed discussion. I hope very much, however, that very one present will preserve his copy long enough to examine it for at least one-tenth as much time as was required for the compilation of the sheet in the secretary's office. In a nutshell, there is more lumber on hand than there was a year ago by perhaps ten per cent. On January 1, 1913, however, stocks were thirty-live per cent lighter than on January 1, 1942, so we are by no means yet back to a normal supply of lumber ready for shipment.

The detailed report of stocks held by sixty-seven firms on January 1, this year, specified by grades and thicknesses, should receive especial attention. It is the first time that we have compiled such a report. It should be of great value in indicating the relative supply of various items. There is a lot of work in the compilation of such a report, but it will be gladly undertaken by the secretary's office just as often as desired if the members will do their part in furnishing the information. Discussion of this subject today will be appreciated.

In addition to the ordinary routine of the association office, especial mention should be made of several prominent features of association accomplishments in the year just closed.

We were well represented at the annual meeting of the National Lumber Manufacturers' Association in Kansas City last June and had an active part in the work of that organization throughout the year. Since the scope and character of the National Lumber Manufacturers' Association makes it possible for this organization to deal only with the broader, general problems which confront the lumber industry, individual manufacturers often question whether they receive direct benefit from affiliation with the larger organization. No one who ever attends a meeting of the National association and really learns what it is doing ever raises this question. It is worthy of our heartiest moral and financial support, the preparation for the Forest Products Exposition by the National Lumber Manufacturers' Association, your president and secretary are having an active part through membership on the committee in direct charge of operations. Moreover, our association members have subscribed for a larger number of shares in the Forest Products Exposition Company than have been taken by any other organization affiliated with the National association. The plans for the exposition are going forward in a satisfactory manner, and our own share in it will be a subject for consideration

We were also well represented at the National Conservation Congress in Washington in November. Although the Congress proper got into the perennial mix-up on the questions of state's rights and water powers, the forestry section of the congress brought together the most practical series of reports and discussions upon lumbering and forestry that have ever been compiled. The work of the forestry section was made possible through a fund of \$5,000 furnished by a number of the most public-spirited lumbernen of the country. The proceedings, including ten valuable committee reports, the addresses on forestry and lumbering, and the more important discussions, sire now being published in a bound volume, which all lumbermen should have. It is my recommendation that the association be authorized to buy 100 copies of this report at a cost of fifty cents each, to be distributed to our members. To do so would be to give only a very small recognition on our part to the valuable work which has been done by the most prominent lumbermen and foresters in the country.

The Eau Claire meeting on October 29 unanimously authorized the president to call a meeting of logging superintendents in Green Bay, and also gave the bureau of grades authority to call meetings of the yard foremen and graders of the members at the most convenient points during the slack period at the beginning of the New Year. The logging meeting held at Green Bay was one of the largest meetings ever held by the association officers, and it developed far beyond expectations both in interest at that time and in the foundations laid for future work along this line. The committees appointed at the close of the meeting have reports to present today.

Decomparently to a unstaken idea on the part of some of the memoers as to the control of the discussions held at the meetings of yard forcing and grader, or Lamary 5 to, some of them did not participate. However, practically all who attended the meetings have expressed themselves as being much benefited by the results, and in favor of future conferences of this character. A brief report of the proceedings of the tyre in Bay another has been cent to our members. The discussion at the other four meetings were along the same lines, with, of course, variations due to the local conditions and attendance. In this connection, it is a pleasure to report that the association inspectors have been constantly on duty throughout the year, and that they have faithfully and honestly tried to serve the best interests of our members.

Following instructions received at the July meeting, we purchased 200 copies of the new harawood rules, effective September 1, 1913 practically all of which have been distributed among the membership. Another authorization for the same purpose is now in order. We had printed last spring 3,000 copies of the revised hemlock rules, which are also practically exhausted, and another edition should be ordered. We get very frequent calls for the hemlock rules from many points of the country.

Our supply of both eastern and western freight rate books will not last much longer. In fact, the western books would have gone some time ago had we not refused to sell copies to any but members of the association. New editions of both books will be necessary as soon as pending questions of freight rate adjustments are settled. The association will come out a few dellars ahead of the game in the publication of these books.

The weekly association Circular has not once missed going into the Friday mail at Wausau since it first appeared in November, 1910. Once in a while it is pretty hard scratching to get material for an issue, but the Circular is published on the theory that its greatest value lies in the fact that it can be expected at the same time every week, and that the information that it contains—even though scant—is strictly up to date. Even members who complain that the information given is incomplete, and not windly reliable, are as quick to read the Circular as are those who faithfully report their sales. To the firms who can always be relied upon to send in reports, the secretary owes a deep debt of gratitude, and he asks that the other firms who often receive benefits without conferring them, will kindly undertake to help out a little more hereafter.

The report of the advertising committee—to come later—will give some idea of our accomplishments in this line of association activity. Could every member read the weekly stream of correspondence and inquiries on this subject, any doubts that he may have as to the effectivenes of associated advertising of our products would be quickly removed. The foundations laid during the past sixteen months are ample for increased publicity in directions where we are sure of getting returns.

The Michigan association and our own will coöperate in a bungalow to be crected at the Forest Products Exposition in New York and Chicago. Our joint appropriation for this purpose is sufficient to pay only for floor space and the assembling of the building. All the material that goes Into it must be secured through donations of interested manufacturers who will receive proper credit for their contributions. Further consideration of this subject should be had today. Moreover, it would appear advisable to hold the spring meeting of the association at Chicago on April 30, so that all the members can that evening attend the formal opening of the Forest Products Exposition in the Coliseum. The exposition will surprise even the best informed lumberman with its demonstration of the extent of our forest resources and the multiplicity of the uses of wood.

The northern lumberman had a prosperous year in 1913-remarkably so in contrast with his brother manufacturers of the South and West. Going over the year's activities, we are justified in the conclusion that there was a normal consumption of lumber in the country as a whole, and that we have no right to expect a greater average yearly consumption at any time in the future. Except in New York City, building operations in 1913 were less than two per cent below 1912, and larger than for any previous year. Crop returns in the Lake States were remarkably good, and failures in Missouri, Kansas and Nebraska were not nearly so disastrous as reported. In the same region, the outlook for a 1914 wheat crop is much above the average. The farmers of the United States received a larger cash return for their products in 1913 than ever before, and are in a generally prosperous condition. A group of leading farm papers claim that 75,000 automobiles are owned by their subscribers. A recent canvass by a leading contracting and building paper indicates a very decided increase in building operations in 1914 over 1913, and this is shared in by every section of the United States.

The tide in general business conditions turned with the signing of the currency bill just before Christmas, and each week since has shown greater confidence and improvement, until orders for steel now exceed shipments. Money is plentiful and easy, and stocks and bonds are selling more readily for investment purposes than for many months past. The president's statement that—"The war between government and business is over"—gives hope that the many yet unsolved problems of finance and industry will be worked out in a spirit of friendly adjustment that will contrast most happily with some previous attempts at political solutions of economic puzzles.

The lumber industry is bound to benefit from this wide-spread improvement and better feeling, although regional overproduction and the competition of other materials may have a retarding influence. In our own territory, we know that stocks are still below normal—that before April,

dry lumber will be as scarce as the mastleating apparatus of the proverbial hen, that no matter how favorable logging conditions may be from now until the break up, the input will be less than was pianned for last fall, and that the time has gone by when there will be an overproduction of northern lumber under anything like normal conditions. This means that the manufacturers of hemlock and hardwoods have every reason to face the new year with confidence and that they should be too busy to listen to knockers.

W. C. Landon moved the appointment of a committee on recommendations to whom these reports were to be submitted. W. C. Landon, C. A. Goodman and Murdock MacLeod were appointed to this committee.

The advertising committee then submitted the following report, which showed a very gratifying condition of progress in the work of that committee:

Report of Advertising Committee

On April 1, this year, we will have completed eighteen months of our association advertising. The results of this campaign have been in excess of the hopes of the committee and we have tried to be very conservative.

To date we have gotten approximately 2,550 direct replies to our birch advertisements and about 1,150 direct replies on hemlock. These have been received in every case solely from the ads in the trade journals and farm papers. In addition to this, we have distributed 4,600 copies of the Book of Plans for Country Buildings through members of our association and retail dealers, and have also sent several hundred birch books and sets of birch panels direct to leading architects who have been reached through personal correspondence.

We have now on hand requests from over 900 contractors, builders and carpenters for birch panels and at present our supply is exhausted. However, a new supply has been provided for by some of our members and stain manufacturers, which will be ready for distribution in about another month.

Our supply of Book of Plans for Country Buildings has been exhausted and we will have unfilled requests for about 300 copies.

Another way we devised for a cheap hemlock book was through the "Jim" book recently issued, 13,500 copies of which have been taken by thirty members of the association for their own distribution, and 7,000

additional copies will be placed direct.

We regularly notify the secretaries of the various retail lumber dealers' associations when we have inquiries from customers in their territory, and they in turn advise the local retail dealers and we have direct information that a great many of the retailers are pleased with this particular part of our work.

Our twelve-page birch story published in December was the largest advertisement for a building material ever run in a trade journal and the replies have been much greater than anticipated, which makes this ad the cheapest one we have had in proportion to the number of answers received. We will have 10,000 reprints of the ad on good paper, without the name of the magazine appearing, which will make us an extremely cheap and effective new birch book for distribution at the Forest Products Exposition and general use throughout 1914.

This committee has gone over a vast amount of the correspondence and inquiries received, and in a great many cases we have evidence of use of birch as the direct result of our advertising.

We have a letter from the manager of the largest sash and door manufacturers in the world, stating that in his opinion our campaign has increased the value of birch several dollars per thousand feet and, while large advertisers of birch themselves, they consider the association can educate the general public to the merits of birch much more effectively than can the individual advertisers who wishes to sell only his own product.

Up to the present time there has been appropriated approximately \$8,600 for our use. Our expenditures have been kept well within that figure and, with the possible exception of our being unable to supply the 300 hemlock books needed before April 1, we will show no deficit.

Your committee is thoroughly convinced that the association can make no better investment than to continue to advertise our products along the lines already mapped out and to broaden the campaign to include certain of the better classes of consumers. The experience we have gained proves to us, at least, that our return from well-placed advertising is directly proportional to the effort expended, and we ask that the appropriation for the next twelve months be not less than \$8,000, which will be approximately one cent per thousand on our 1914 sales. This is very much less than is being spent by the advertisers of other woods, but we feel that it will be enough to enable us to economically continue the good work now under way.

Secretary Kellogg said, in speaking of the Forest Products Exposition, that the association has joined with the Michigan Hardwood Manufacturers' Association in shaping up the joint exhibit, which will be in the form of a bungalow made from woods growing in the Lake states. The woods represented will be hemlock, birch, maple for interior work, framing, etc. Mr. Kellogg said work is progressing in a satisfactory manner, but that it appeared to be

necessary that the exhibit be made in implicate, as only ten days elapses between the Chicago and the New York shows. The matter was referred to the committee on recommendations.

J. E. Rhodes, manager of the National Lumber Manufacturers' Association, then talked regarding the work of that organization. In speaking of the fiber and wooden box controversy, Mr. Rhodes said there is a growing disposition on the part of the railroads to give goods shipped in fiber containers fair treatment. Mr. Rhodes said that the Interstate Commerce Commission should reach a definite decision in this matter at an early date. Mr. Rhodes also spoke of the experiments for fireproofing woods, and then went on to tell of the progress of the work done in connection with the proposed five per cent horizontal advance in freight rates. In speaking of the Forest Products Exposition he said that as it is now lined up its success is assured inasmuch as the various associations have come forward gratifyingly in their subscriptions for space.

Mr. Rhodes' version of market conditions was that prospects for 1914 are much brighter than at the beginning of 1913.

Secretary Kellogg read the paper prepared by H. R. Isherwood, manager of the Sawyer Lumber Company, Sawyer, Wis., treating of wood silos. The paper demonstrated clearly that a great injustice has been done to the silo made from the products of the forest. He substantiated this claim by citing instances, one of them being a meeting of the Farmers' Institute held at Sawver recently, which Mr. Isherwood attended. Two of the topics for discussion were silos and farm buildings. Mr. Isherwood said that the chairman of the institute distributed a number of cement booklets which had been sent to him, and that he, Mr. Isherwood, endeavored to pin the chairman down to a reason for recommending the use of cement for silo construction. The chairman replied that the use of wood in silo construction is absolutely prohibited under present conditions by the high prices. He added that the wooden silo costs more to erect than does one constructed of cement. The same man also spoke of the use of cement in barns, saying that in no instance should lumber be used in the stables.

The point brought out by Mr. Isherwood was that, inasmuch as these lecturers are employed by the state and paid by the tax payers, it is not fair that they should be permitted to recommend one substance as against another substance equally entitled to consideration. He suggested that the time has come for the manufacturers and retailers of lumber to get together in their own defense and endeavor to secure some of the representation which the cement interests have secured in these public demonstrations.

C. H. Worcester spoke along the same lines, dealing more particularly with the activities of manufacturers of substitutes in connection with the proposed legislation on the prevention of fire. He cited as an instance the meetings of the fire prevention committee of the Association of Commerce of Chicago, which were attended by architects and insurance men who had for presentation plans of frame and fireproof construction, and figures tending to show that the homeseeker does not need to make any materially increased outlay for so-called fireproof material, the difference between that and the wooden construction being only from ten to fifteen per cent. Mr. Worcester said that he had challenged this statement, figuring that the difference ran from twenty to twenty-five per cent, on a conservative basis.

Adolph Pfund, secretary of the Wisconsin Retail Lumber Dealers' Association, congratulated the secretary and advertising committee on the efficient publicity work they had done on hemlock. He invited Secretary Kellogg to attend the next meeting of the Wisconsin retailers.

A. L. Osborn moved that the nominating committee be appointed, and the chair named R. B. Goodman, A. R. Weeks and C. H. Worcester.

The meeting then adjourned for luncheon, which was served in the convention room.

In the absence of George H. Chapman, Secretary Kellogg reported for the railroad committee. Mr. Kellogg stated that two important subjects had come before that committee, namely, the

Missouri river rate case and the proposed five per cent advance in rates on eastern railroads. He said that neither of these subjects had been entirely completed.

According to Mr. Kellogg, a formal complaint was made in connection with the Missouri river rate case, asking for a reduction of lumber rates west, in July, and a hearing was asked. This hearing was set for January 14 at Minneapolis, but was cancelled and no new date has as yet been set. The railroad committee has been busy preparing evidence and is now ready, having everything in shape to present at the proper time.

Regarding the five per cent general increase, Mr. Kellogg said it has only been possible to keep in touch with the developments in that direction through the railroad committee of the National Lumber Manufacturers' Association. He said no formal action had as yet been taken.

W. H. McDonald, chief inspector, read his semi-annual report as follows:

Chief Inspector's Report

In submitting my annual report for the inspection department of the association during 1915. I find that much good work was done during that time, and can see much improvement in the way of better pilms in the yards, grades more in to the standard, and a better understanding among the manufacturers as to why the inspection department of the association is maintained. Both Mr. Ball and myself have been on the road continuously during the year, and the following figures will show you just what has been accomplished:

Leymor Issue to refer the Mr. Ball Mills Points

Dier of calls where no stock was moving.

I Hemlock
Amount below grade, 54,549 feet or 17 per cent.
Amount above grade, 720 feet.
Amount below grade, 22,623 feet or 7 per cent.
Amount above grade, 1,417 feet.
Pine

If any member thinks that we have slighted him, it certentional, as we mean to do all we can for all of you.

I have noticed that some of the manufacturers are not paying enough attention to the piling of their lumber in the yards. In order to avoid having stained lumber, I would suggest that you raise the foundations so as to give better circulation under the piles, make larger chimneys through the center, and use narrow cross pieces. This will also basten the seasoning of the lumber.

Much improvement can be made in the manufacturing of the lumber. Manufacturers should pay more attention to this, as a good many concerns are not getting the best results from their logs. The manufacture of lath, as well as the grading, also needs more attention at a number of the mills. We have had a number of complaints on lath that could have been avoided if a little more care had been exercised.

As to the grading down of stock in the yards, a good many graders are inclined to be careless, and while we have checked them up about it, in some places it doesn't seem to do any good. This is the cause of much

depreciation in the stock.

I am calling your attention to these points, hoping that it may help in bringing about a better condition in the manufacture of lumber, better sorting at the transfer, and piling. If this is done, it will lessen the

degree, it on it, the stock and increase your profits

You of course have all heard of the meetings of the yard foremen and inspectors held at Green Bay, Iron Mountain, Ashland, Eau Claire and We issue the first of January - I wish to say that I believe, judging from the interest taken at these meetings, that we have struck the right chord. We brought up the most valuable topics to the manufacturers, such as sawing logs to obtain the most of the upper grades possible, sorting lumber on the chain as close as possible, pilling on high foundations with the pitch in the foundation, and thus avoiding the depreciation caused by putting one piece on top of the other in building the pitch in the pile and causing stock to stain in the bottom of the pile, careful methods of handling lumber to avoid depreciation, and so on. The new grading rules were taken up and a general discussion of the technical points was had, and I believe a better interpretation and understanding was gained in this way than any way we could adopt, as we were well supplied with samples of lumber containing all kinds of defects, especially at our last meeting held at Wausau. The form of sawing logs was gone into very thoroughly by the manufacturers who were present-also by the sawyers and all agreed that sawing to a 61%-inch cant is the most profitable way to saw hardwood logs, and I will say right here that some of the manufacturers use the same system of sawing their hemlock logs, claiming that they get more No. 2 and better than they would by sawing up their hemlock logs

Last year our time was taken up more or less with the inspection of pine. Very few manufacturers who are handling pine are paying dues on It. In case of dispute over the grades, an association inspection is called for. In this case, where the manufacturer isn't paying dues on pine, a charge of actual traveling expenses plus \$4.00 per day has been made. I would suggest that all of you send in an estimate of your pine, and pay dues on it. This would give us money enough to employ another inspector, and thus be able to give you more service, as well as cover the pine inspections

After having made reinspections where the manufacturer has been the loser, I have received complaints to the effect that we make the grades harder in the yard than we do on the reinspection. Such complaints are unfounded, and I wish to say that in deciding grades we make them the same at the mills as on reinspection work. The rules adopted by the association are the rules that govern our work. No one has any influence with us in this respect, whether manufacturer or consumer. One grade to all is our policy, and an association that does not maintain such a course is better off without an inspection department.

M. J. Quinlan, chairman of the bureau of grades, stated that, considering the able and ample report of Mr. McDonald, he felt he did not have much to add. Mr. Quinlan cited instances showing the benefits of the "get-together meetings," in which grades and stocks had been discussed. He said that some apprehension was felt last summer regarding stocks of hemlock, but that a panic was averted by actual figures brought out at one of these gatherings.

He commended the accomplishments of the meetings of yardmen and inspectors, and said that their continuance is up to the membership.

Mr. Quinlan said that there had been some excellent sales of hardwoods; prices tending upwards in maple as shown by actual sales. Mr. Quinlan said, however, that in No. 3 hemlock and hardwood there had been some little shading, for which he can find no excuse or reason, as there are no considerable quantities of logs in the woods anywhere, or stock at the mills. He said, however, that hemlock is going to advance in price, and in fact it has already shown a tendency in that direction.

J. C. Knox, secretary of the Michigan Hardwood Manufacturers' Association, spoke of conditions in the territory covered by members of his association, saying that the same condition as reported by Mr. Quinlan prevails there. Stocks are not more than normal anywhere, and in some places are actually less than normal. He said that on January 1, 1913, there was little less hardwood stocks than now, but that there was never a time when yard stocks were smaller in lower Michigan than at the end of 1912 and the begining of 1913; that they were much less than normal then and that a slight increase now is of no particular significance. He said there is 20,000,000 feet less of hardwoods now than January 1, 1912.

C. H. Worcester, who was delegate of the association to the Conservation Congress at Washington, outlined the work done by the Congress, and said that he believed the efforts of lumbermen and the difficulties they encounter in following out the conservation policies advocated, are being recognized. He said that the future action of the Congress must help lumbermen to that end. He also said that the former sentiment of Congress was that lumbermen as a general thing are vandals, but that this sentiment is gradually

becoming a thing of the past and that the purely theoretical conservationists are beginning to recognize the need for sufficient returns in order to warrant private concerns and individuals undertaking conservative action along the lines of conservation.

He particularly recommended that more lumbermen attend the meetings of the Congress, and suggested the advisability of a separate forestry congress.

W. A. Holt of the welfare committee spoke for that committee in the absence of Chairman Rowlands.

After considerable discussion covering the various points brought out in the report and as to the practicability of endeavoring to treat the lumber jack to modern civilization, the report was accepted and placed on file and the committee discharged.

R. B. Goodman, chairman of the logging accounts committee, read a most able report, which will be found on another page of this issue, under the title, "Practical Logging Accounts."

The report was followed by a general discussion of experiences in this direction, and on motion was accepted and the committee discharged, the secretary being instructed to follow out the instructions of the committee.

The committee on resolutions and recommendations then reported through W. C. Landon, chairman, as follows:

Wirkeas, It is the sense of this meeting, that the work of the advertising committee has been successful and the expense justified; be it therefore-Resolved. That the present committee continue in charge of this work and that it be given the continued and united support of the membership, and be it further.

RESOLVED, That an assessment of 1 cent per 1,000 feet on all shipments made by the members of this association for 1914 be made and collected in the usual manner, and that the proceeds of such assessment be appropriated for the advertising of our products in such manner as the advertising committee deems most advisable.

This committee recommends that the work done by the advertising committee in connection with the Forest Products Exposition be approved and the pians so far made by it be and are hereby indorsed.

The committee recommends that this association continue its membership in the National Lumber Manufacturers' Association for 1914, and pledges its most hearty cooperation and support to the work of that association.

The comittee recommends that the board of directors arrange for another meeting of logging superintendents, at such time during the year and at such place as seems to them most advisable.

The committee recommends that another series of district grading meetings be held at such times during the year and at such places as may be designated by the bureau of grades.

WHEREAS, Wisconsin is a large producer of lumber and not of substitutes thereof: and

WHERRAS, It is a matter of current report that the exploiters of various substitutes for lumber have enlisted the aid of certain state officials and departments in presenting to the public generally, and more especially to the farmers' institutes held throughout the state, the advantages claimed for such substitutes, be it therefore

RESOLVED, That this association condemns such special work on the part of our state officials and departments, and recomends that our legislative committee investigate such reports, and if same are found to be based' upon facts, to report back to this association what is necessary to be donethat such practice be discontinued.

This committee recommends that the secretary attend the next annual meeting of the Wisconsin Retail Lumber Dealers' Association, and arrangeas far as possible for the coöperation of the two associations in questions of mutual interest.

The report was adopted as a whole.

The nominating committee then reported the following recommendations for officers for the coming year:

PRESIDENT—R. B. Goodman, Goodman, Wis.

Vice-President—J. T. Phillips, Green Bay, Wis. Treasurer—George E. Foster, Mellon, Wis.

DIRECTORS—E. A. Hamar, Chassell, Mich.; W. C. Landon, Wausau, Wis.; W. B. Clubine, Park Falls, Wis.; A. C. Wells, Menominee, Mich. The secretary was instructed to cast a white ballot, which placed

these gentlemen in office.

In relinquishing the gavel, Mr. Hamar expressed his appreciation of the support he had received, and asked that the same support be given his successor in office.

The new president was escorted to the chair by Mr. Quinlan and! Mr. Phillips.

Mr. Goodman said that he was somewhat encouraged by the tone of Mr. Hamar's remarks, masmach as Mr. Hamar had expressed himself as having accepted the other originally in fear and trembling, and Mr. Goodman felt the same trepidation, but trusted that there was at least a chance of his pulling through.

A new committee on bureau of grades was then announced as follows: M. J. Quinlan, E. A. Hamar, M. J. Fox, C. A. Goodman,

L. G. Earle, G. N. Harder and P. S. McLarg.

President Goodman then recommended the formation of a permanent committee on efficiency in logging, manufacturing and other phases of lumbering in which the association members are directly interested. He said that he believed such a committee would be one of the most valuable features of the association work and asked that the question be given consideration.

J. J. Ott of Eau Claire moved that the question be left to the discretion of the president and the board of directors, who were to appoint the committee and outline the work. This motion was carried unanimously.

E. A. Hamar read a telegram received from the Northern Forest Protective Association inviting the association to hold its meeting of logging superintendents on March 10 at Marquette, Mich. On motion, the question was referred to the board, and Mr. MacLeod suggested that the next meeting of the association be held at Chicago April 30 so as to enable the men to attend the Forest Products Exposition. The motion was unanimously carried.

 $\vec{J},$ J. Ott then moved that a vote of thanks be tendered the retiring officers, and also that the meeting adjourn, which motions

were duly carried.

Practical Logging Accounts

Editor's Note

The following article is the report of the committee on logging, read by R. B. Goodman of Goodman Wis before the recent meeting of the Northern Hemlock and Hardwood Manufacturers' Association at Milwaukee. It contains such valuable suggestions that could be used in connection with almost any logging operation that it is here reproduced as read.

It is not the purpose of this committee to devise a system of accounts covering logging operations, nor recommend forms of keeping costs—for we realize that all members of this association have solved these problems more or less to their own satisfaction, and in view of the great variety, both in size and character, of the operations and the still greater variety of conditions and methods employed, the manner of accounting and reporting used by each member is surely more desirable than any plan your committee could make for him without knowing in detail all the facts in the case.

It is the purpose of the committee to point out ways by which these various forms and methods of accounting may be made, if not uniform, at least susceptible of intelligent comparison. We all recognize the value of comparison—in fact all our standards and all our judgments are relative.

There is in the logging business no absolute standard of costs; no absolute standard of method. We say the cost of keeping men is high compared with last year or the year before, or we may mean that it is high at one camp compared with the cost at another camp—and so with our cost of skidding, railroad building, or any other subdivision of the cost of logging. We are all of us quite positive in our judgments, not because we know that our accounting is perfectly accurate, but because we know that it is done the same way that it was done last year, or the year before and that it is done the same for one camp as for another—so that our accounts are extremely valuable to us and any relative change in the costs at one time over another, or at one place over another, calls for prompt investigation and often the discovery of a leak of some kind, the stopping of which saves us money.

How much more value would these records of costs have if we were able to compare them not only with our own past, but with all of our competitors present. In this connection, we wish to borrow a comparison used by Mr. Eddy in the paper on "The New Competition" which we believe is to be read at this meeting of our association-the chief underlying principle of modern enlightened competition is pointed out in this paper and is exemplified not only by the theory of our own association, but the real underlying principle of all trade associations that each individual member is benefited not only by knowing what his competitor is doing, but by having his competitor know what he is doing. Mr. Eddy imagines a race course in which each horse runs in a walled alley. You will see that in such a race the winning horse might have exerted himself much more than he needed to; or it may be that the second best might have exerted himself a little more to have won the race, and whereas along at the other end, some of

the horses hopelessly in the rear could have saved their breath by walking.

Your committee is laying so much stress on this matter, for it realizes that if the members themselves do not appreciate the value to themselves in comparing frankly and openly their various costs accounts, they will not take any interest in our effort to point out means of making these comparisons. For this purpose, your committee has prepared a "card of accounts." It has endeavored to use existing phraseology as closely as may be and while names in themselves are not absolutely essential, we recommend that the members study this card of accounts carefully and endeavor, as far as possible, to change any names that are now used that conflict with the names in this card. Your committee has also received letters and account forms from many of the members, which have been of great help to it in preparing the card of accounts, and as all of these forms and the letters explaining them are of interest, we have prepared an exhibit of these reports which may be examined at the close of this meeting and no doubt extra copies of any particular form may be obtained of the member who is using same.

CARD OF ACCOUNTS FOR LOGGING OPERATIONS OF THE NORTH-ERN HEMLOCK AND HARDWOOD MANUFAC-

TURERS' ASSOCIATION.

January, 1914
: Unit of Measurement:

CONTENTS: Depreciation; Unit of Measurement; Unit of Expense. SECOMARY ACCOUNTS: Cost of Men; Cost of Horses; Cost of Machinery, Diagram on Accounts.

EXPLANATION OF ACCOUNTS

Depreciation

Horses, men, machinery, buildings, equipment, road and spurs, all depreciate in value through the ravages of time, and the wear and tear of use. It is not feasible to consider the depreciation on all of these items as a single item of general expense to be added to the cost of logging as an overhead item. We therefore indicate in the respective accounts just what items of depreciation should be covered.

Unit of measurement-1,000 feet.

The legal standard of measurement of logs in the state of Wisconsin is the Decimal C, but in a large part of the state operators are using both the Scribner Rule and the Doyle Rule. The relations between these rules are not constant but vary with the size of the logs. Doyle Rule may give more feet than the Scribner Rule under certain conditions and in all scales the over-run is greater the larger the number of pieces.

Sielch Hauling

| Divorant of Accorns | Stim (age | fram potention | CR R Prought | GR R Mainton to | GR R Depreciation | | Contact | Contact Logging | Lyons | Rouds and Spins | Depreciation | Camps | Sawing | Actual Logging | Skidding | Decking |

EXP VALON OF ACCOUNTS: Reference to preceding Diagram of Accounts will show the relative place of the various accounts: Sawing, Swomping, Skidding, Loading, Sleigh Haufing, Decking,

These accounts are the subdivisions of actual logging. If the toreman has correct figure for the cost per day of man, horse and machine, he can easily obtain the total cost per day on each of these accounts, which divided by the thousand feet of logs sawed, swamped, skidded, etc., gives him the cost of each operation. In taking up these costs, he should apportion his own day's work and that of the scaler over the various accounts.

Total Logging: This account represents the cost of actual logging as defined above—plus the general logging expense, roads and spurs, depreciation of camps—that is to say that the total logging cost is cost from stump to cars, including everything.

COST OF HORSES

DEPRECIATION: Horses in active service with good care depreciate fifteen to twenty per cent of their cost per annum, or about \$100 per year per team, and if a team works 200 days in the year, the depreciation charge per team would be fifty cents or twenty-five cents for one horse per day.

DAILY KEEP: The cost of keeping a horse per day is figured on the same principle as for keeping a man. Veterinary services, blacksmith and harness repairs should be included.

Cost of Machinery

DEPRECIATION: By depreciation of logging machinery, we mean its annual loss in value through obsolescence, and have no reference to the wear and tear through use which is understood to be made good by repairs and renewals of parts. This obsolescence may vary with different machinery, under different conditions, but as the scrap value of logging machinery is practically nil, depreciation should be figured so as to wipe out the entire cost of the machine when the work it has been purchased for is completed. Where the expected life of the machine is over ten years, it is safe to say that at the end of that time it is so liable to be supplanted by a more improved machine, that its cost should be wiped out—so that the minimum depreciation per annum for woods machinery, should be ten per cent of its cost and the daily depreciation charge should be the annual depreciation, divided by the estimated number of days the machine works through the year.

DAILY KEEP: This is the wages of engineer, helper, watchman, coal, oil, waste, repairs, gasoline, water, cables, etc., for the month, divided by the number of days the machine works required to make a thousand feet. It is customary to allow for crooks and defects in logs when applying any rule, except in some cases when the scale is taken to determine the freight and we understand paper mills buy logs full scale, not deducting for crooks or white shake-the only deduction they make being black shake and rot. The paper mills claim this gives fifteen per cent more scale than sawmill scale. In order for the sawmill managers to compare logging costs, it ought to be figured on lumber basis. This elimininates the difference in scale, but we do not think it a good idea to give the camp superintendents figures on this basis, and we therefore suggest that in figuring our unit of measurement for logging cost, we state the scale used, the number of pieces to the thousand and what deductions are made for.

UNIT OF EXPENSE: (Day's Work): It is essential for purpose of comparing costs, that the unit of expense should be accurate. The unit of expense for man, horse or machine is a day's work—and

the cost of this day's work is the wage cost of the man, the depreciation charge of the horse and the machine. These costs must be determined from actual accounts and, in most cases, can best be determined by the bookkeeper and the figures furnished from time to time to the logger. They are determined from the following "secondary accounts."

SECONDARY ACCOUNTS

DAILY WAGE: Total monthly wave divided by number of days worked equals daily wage.

DMLY KEEP: Wages of cook, cookee, chore-boy, fuel choppers, cost of all cook supplies, corrected by inventory—renewals of dishes, beds, bedding, disinfectants, maintenance of camp, etc., for a month divided by the total number of days of productive labor, equals the daily cost of keep per man.

ACTUAL LOGGING: This account has been defined above.

GENERAL LOGGING EXPENSE

Salary and expense of logging superintendent, cruisers and all other items of supervision, office expense, expense hiring men; liability insurance should be added to this account unless it should be desired to add same to a percentage of the individual wage in which case it would appear in the secondary accounts—cost of men.

ROADS AND SPURS: This account represents the cost of building railroad branches, but not the main line; the cost of all sleigh roads and should be charged against logs at a rate that will wipe out the account when the total in-put of logs over these roads and spurs is completed.

DEPRECIATION OF CAMPS

Wheels camps will probably be depreciated at the rate of ten per cent per annum; stationary camps at a percentage per annum that will wipe them out in two, three or four years, as the life of the camp may be. The monthly proportion of this depreciation should be charged against the cost of logs under this account.

COST OF LOGS AT MILL

The cost of logs at mill includes the cost of stumpage, the freight or transportation and the total cost of logging. It is equivalent to the purchase price of logs delivered at mill, where the purchaser is buying logs instead of cutting his own timber.

STUMPAGE

Whatever method is used in figuring by the various operators, to determine the cost of stumpage cut, it is certain that this charge must contain, in addition to the original cost of stumpage, a fair allowance for the carrying charges, taxes, fire loss, supervision of timber land, etc., accruing each year. If timber more accessible to the mill than the average is cut, this should be averaged by increasing the stumpage charged.

TRANSPORTATION OR FREIGHT

If the logs are hauled by a common carrier, this account is simply freight, switching charge, demurrage, etc., including cost of staking cars. If the operator transports his own logs either by sleigh haul or steam railroad, or by driving, toll or transportation charge per thousand should be sufficient to cover the actual operating cost, the cost of maintaining the equipment or railroad tracks and grades, and the depreciation figured on the cost of main line of the railroad, or other permanent improvements divided by the total logs estimated to be carried.

PIECE WORK

The above eard of accounts is intended to cover only general logging operations. Where piece work of various kinds is carried on at the same camp where logging is done, the cost of this piece work should all be kept separate from the cost of logging—that is to say the cost of logging should not be decreased in any way by the profit on piece work or wagon accounts.

Turning away a lumber salesman with a curt "nothing doing today" is a poor way to keep informed on what is doing in the lumber market. Time given to hear what the salesman has to say is generally well spent even if you don't need anything that day.

Oak is the big dog in the hardwood puddle, representing over a third of the total hardwood lumber production for 1912.

Lamb-Fish Company as Host

There are functions and functions, but the excursion to its big Charleston, Miss., plant engineered by the principals of the Lamb Fish Lumber Company a few days ago eclipsed anything in previous history in the way of entertanment for lumbermen.

GARRETT E. LAMB, CHARLESTON, PRESI DENT

President Garrett E. Lamb and General Manager Walter B. Burke of the Lamb-Fish Lumber Company are justly proud of the great manufacturing enterprise which they have built up, and which is under successful operation.

Taking advantage of the meeting of the Hardwood Manufacturers' Association of the United States at Memphis, the latter part of January, the gentlemen referred to invited a large number of their contemporaries, lumber buyers and lumber newspaper friends to join them in an excursion from Memphis to Charleston and return. The invitation was gladly accepted.

The party was conveyed to Charleston from Memphis on the evening of January 22 in a special train of Pullmans, which arrived at Charleston early the following morning. Here surprises awaited the visitors. The first surprise was a breakfast that was served in the handsome clubhouse which would do credit both in menu and service to any hotel in the country.

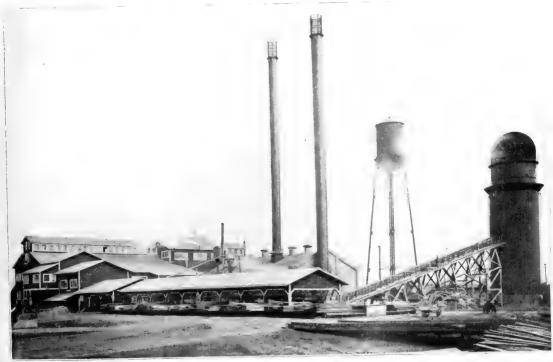

The morning was spent in visiting the great sawmill plant of the company. This mill is the largest hardwood mill in the United States and has an hourly capacity of approximately 10,000 feet of oak, gum and other hardwoods. Twenty years ago when a white pine mill

was creeted at Duluth with a like capacity it was regarded as a phenomenon in sawmills, but this output means a good deal more in a hardwood mill of this enormous capacity.

The operations of the Lamb-Fish Lumber Company are unique in many respects. The

W. B. BURKE, CHARLESTON, GENERAL MANAGER

A FEATURE OF THE DAYS ENTERTAINMENT

logs are delivered by train in the usual method, and Brownhoist locomotives remove the logs from cars and assort them in skidways contiguous to the 500 feet log haul-up.

The unique feature of the mill is Manager Burke's patented flitch handling device for the feeding of the resaw. This is absolutely a mechanical operation by means of which the saw is always in the cut. There probably never has been a band-saw in use that resawed as many lineal feet of flitches as this saw is doing. A second resaw again splits the product of the big resaw into thin lumber. Every mechanical device that will contribute to the making of high class lumber at fast speed is employed at the Lamb-Fish mill, and it is

certainly doing marvelous work, both in quality of product and in quick execution.

A good many of the visitors were highly interested in the Kraetzer steam preparator apparatus through which the Lamb-Fish people handle all their lumber for insuring quick and accurate seasoning. After steaming this wood under pressure through the Kraetzer equipment, the sap gum is handled through the dry kilns on the same trucks and also some of the red gum. However, a large portion of the stock is transferred to storage tracks in the yard on the same trucks until shipping dry, when it is loaded out.

The company advises that it is shipping sap and heart gum after

GROUP OF GUESTS ON THE STEPS OF THE CLUB HOUSE

CORNER OF STORAGE YARD, LAMB-FISH LUMBER COMPANY

steaming and passing through the dry kiln, in from four to six days from the saw at an average weight of less than three pounds to the foot, while the oak and other woods are reduced to less than normal air dry weight, and are being shipped in from thirty to forty days from the saw without the employment of the dry kiln.

There are very many other interesting features about the Lamb-Fish Lumber Company's plant which were carefully examined by the visitors.

An elaborate luncheon was served the visitors at the clubhouse at noontime, and the afternoon was spent in general contribution to the "gayety of nations" in which encounters between amateur colored puglists from a Memphis athletic club were an important element.

An improvised tennis game among the visitors was another fea-

SHOWING THE KRAETZER PREPARATOR IN USE AT PLANT OF LAMBUISH LUMBER COMPANY

ture of the afternoon, and there were card games and foolish stunts of many sorts which took up the entire afternoon until dinner time. The dinner evolved itself into a banquet, at which W. G. Wilmot of Chicago acted as toastmaster. It was a very enjoyable function, both in gastronomic and intellectual delights.

At midnight the party again boarded a special train and was safely delivered at Memphis early Saturday morning. The trip was certainly a piece of enterprise on the part of Messrs. Lamb and Burke, which will not soon be forgotten by the participants.

A set of resolutions of congratulations and thanks was formulated by the party and presented to the hosts as a slight evidence of the appreciation of the visitors.

The pictures accompanying this article will tell some of the details of the function better than the text.

Spanish Cedar for Cigar Boxes

The bulk of Spanish cedar (Cedrela odorata) used in the United States for cigar boxes and clothes chests is imported from Mexico and the West Indies. Porto Rico at one time produced this wood in large quantities, and there is no reason why it should not be planted and grown there on a commercial scale by private owners and by the government. If there is one tree that can be grown successfully and profitably it is the Spanish cedar, for no other valuable tree in the American tropics makes such a rapid growth as this one. It is believed that a large part of the supply of this timber could thus be produced at home, and if grown in the forests regulated according to the best methods, a very satisfactory crop of cedar logs could be grown in a surprisingly short time.

There is a very good demand for Spanish cedar and there will be thirty or forty years from now. Companies are now being organized to plant eucalyptus and Australian pine (Casuarina) in the West Indies, and while these trees grow faster and produce logs in a much shorter time, the woods have no established market value and no long list of special uses. With Spanish cedar there is a marked tendency for natural regeneration throughout its range of growth. This is the case especially on cut-over or cleared land, but being light-demanding during early life the young growth is frequently crowded out by the less important vegetation. This accounts for its manner of occurrence, which is just an occasional tree scattered among other kinds in the dense tropical forest. With the continued and exclusive cutting of Spanish cedar, other species gradually supplant it and the forest ceases to produce it.

The possibility of its extensive production from planting has been demonstrated in parts of the West Indies, where this tree has been planted extensively for shade and ornament. The examples in a number of gardens show a remarkable growth for their age. Indi-

viduals only about sixteen years old have acquired a height of from fifty to sixty feet and a diameter of between fifteen and twenty inches at breast height. This would seem to indicate that this tree would prove invaluable for reforestation on the denuded hillsides in Porto Rico and other West Indian islands where the timber is getting very scarce. Its rapid growth makes it eminently suitable for this purpose. It produces great quantities of seed at a comparatively early age. Considering all these qualities, Spanish cedar promises to be one of the most valuable trees in the West Indies.

The largest use of Spanish cedar both in Europe and the United States is for making cigar boxes, and many millions of feet are used annually for this purpose alone. The wood having slightly figured grain is often very pretty and is worked up into furniture and interior finish. The very best grades are frequently cut into veneers, which are glued either on cheaper woods or on plain cedar. The most handsomely figured wood is used for the same purposes for which mahogany is so much employed. Okoume (Boswellia kleinei) from Portuguese Africa is now used as a substitute for Spanish cedar in the cigar box industry. Although much lighter in color and weight, its grain frequently closely resembles the tropical American wood and is not easily detected by a mere superficial examination.

L. L. D.

Manager George S. Wood of the Forest Products Exposition Company states that the affairs of the exposition are going along very nicely. The work of lining up associations and individual concerns for exhibits at the Chicago and New York shows is succeeding as well as was expected and from the very cordial way in which the idea is being accepted universally throughout the lumber, woodworking and machinery lines, it will be a pronounced success.

Wood Uses in South Carolina

The state of South Carolina has published a report of its woodusing industries for 1912. The report was compiled and written by Stanley L. Wolfe of the United States Forest Service, under a co-operative agreement between the government and the state.

South Carolina is not one of the leading states either in the production of lumber or in manufacturing it into finished products; but both the mill industry and the further manufacture of the wood are well established and prosperous. The state has always been more noted for its agriculture than for its factories.

The ratio between the output of rough lumber by its sawmills and the product of its factories which make use of wood as raw material, is about as two to three; that is, two-thirds of its production of lumber is consumed by, establishments in the state.

Thirty-one woods are used, three of which are foreign. The following table shows these woods and their average values delivered at the factories:

Kind of Wood Shortleaf pine	Annually (Ft. b. m.) 254,449,500 93,560,400	Average Cost per 1,000 Ft. \$ 14.17
	254,449,500 93,560,400	
Shortleaf pine	93,560,400	8 14.17
Longleaf pine		14.39
Cypress (bald)	17,938,000	21.52
Red gum	12,726,000	13.81
Loblolly pine	11,880,000	12.89
Yellow poplar	10,135,000	17.17
Black gum	6,179,300	13.72
Cotton gum	3,527,000	12.59
White oak	3,133,900	22.27
Dogwood	3,050,000	21.97
Persimmon	1,550,000	18.06
Ash	1,518,000	19.80
Sugar maple	1,471,100	19.55
Red oak	997,200	18.84
hickory	422,000	25.38
Chestnut	401,000	20.01
White pine	166,900	88.93
Basswood	165,000	45.88
Elm	100,000	12.00
Spanish cedar	75,000	140.00
Birch	48,400	37.00
Sycamore	45,000	16.33
Cottonwood	32,000	19.13
Beech	25,000	20.00
Silver maple	20,000	16.00
Spruce	13,000	34.31
Southern white cedar	11,100	30.81
Black walnut	10,000	80.00
Red cedar	10,000	60.00
Mahogany `	5,500	149.64
Lignum-vitæ	207	285.75
Total	423,665,507	\$ 14.80

The hardwoods make a comparatively poor showing. They amount to about 40,000,000 feet against 383,000,000 for softwoods. However, there are twenty-two hardwoods and only nine softwoods. Red gum leads the hardwoods in quantity, while elm is cheapest.

Fourteen industries are specially reported, and a number of others are grouped as miscellaneous. Nearly seven-eighths of all the wood reported is made into planing mill products, consisting principally of flooring, ceiling, and siding. The table which follows names the several industries and shows the quantity and average price of the wood demanded by each of them:

	Quantity Used	
	Annually	Average Cost
Industry	(Ft. b. m.)	per 1,000 Ft.
Planing mill products	. 368,301,000	\$14.22
Sash, doors, blinds, and general millwork.	25,936,000	20.76
Baskets, fruit and vegetable packages	7.800.000	13.14
Boxes and crates, packing	6.160,000	13.03
Shuttles, spools, and bobbins	5,100,000	20.59

('askets and coffins	14.59
Car construction	16.56
Furniture 1,518,000	13.46
Vehicles and vehicle parts 784,300	27.15
Ship and boat building	34.12
Handles	34.02
Fixtures	34.59
Agricultural implements	27.63
Patterns and flasks	63,36
Miscellaneous	34.05
Total	\$14.80

The making of spools, shuttles, and bobbins is a comparatively large industry in the state, and more dogwood is reported in South Carolina than in any other state. It is made into shuttles. In the manufacture of this article from dogwood fully seventy-five per cent of the wood is wasted. In speaking of the shuttle the report says:

"The shuttle has an interesting history. It has come down from the old hand-loom shuttle which was thrown by one hand and caught by the other. At that time nearly any wood that was smooth would answer. But the power loom throws the shuttle by violent strokes with a stick, and few woods will long stand the blows. The life of the best shuttle is measured by hours, not years. Formerly Turkish boxwood was used almost exclusively. and it still has no known equal, but its use by the roller skate factories at high prices, took it out of the shuttle market years ago. The world has been ransacked for other woods. Persimmon and dogwood are the two most satisfactory, when all things are considered, but scores of others have been tried. Some quickly wear through, some become rough, others burst or break in a few minutes or within an hour or two. Some are too heavy, others too light. Steel cannot be used for this purpose; when made sufficently light the metal shell buckles and kinks. Dogwood, the diminutive tree which once had practically no use, except as gluts for splitting rails, and as distaffs for spinning wheels, has now become the most important wood in this country for the particular and highly important use of shuttle making."

In the manufacture of vehicles in South Carolina, yellow poplar leads all other woods in quantity, and only white oak is above it in price. The poplar is used for wagon beds and for buggy and carriage bodies, for which use no wood ranks above it. Hickory is next to poplar in amount, but its place is wholly different. It is made into spokes, shafts, and poles of light vehicles.

The problem of saving what was formerly waste is attracting attention in the state. The people realize that they are not getting so much out of their forests as they ought, and measures are being taken to remedy the weak place in this industry.

A report made three years ago, and quoted in the present one, shows a rather unusual state of affairs in South Carolina regarding lands and forests. There are said to be 6,000,000 acres in farms, 5,532,000 acres of forest, and 8,209,000 acres 'unimproved.'' That classed as unimproved is understood to consist of areas cut over and burnt over, and left unprotected so long that they are simply ''woods.'' Much of it is doubtless land from which the yellow pine was cut years ago, and it was never cleared for plantations, and never relapsed into forest again.

Those who wish to compare the quantities of different woods cut in the state with the amounts further used for manufacturing purposes, will find the sawmill cut for 1911 in the following table:

			Board reet
Yellow pinc	 	 	 533,552,000
Cypress			
Red gum			
Oak	 	 	 7,679,000
Yellow poplar	 	 	
Tupelo	 	 	 2,270,000
Ash	 	 	 1,652.000
Hickory	 	 	
Maple	 	 	 302,000

'edar	218,000	Sycaro	28,000
Chestnut	209,000	Beech	13,000
Hemlock	203,000	Birch	2,000
Elm	140,000	All others	101,000
Cottonwood	101.000		
Walnut	32,000	Fe fal	84.872,000

Protecting Ties Against Wear

Editor's Note

At the annual meeting of the American Wood Preservets' Association at New Orleans January 20/22, the following paper suttified, "The Protection of Thes from Mechanical Bestriction," was road by Howard F. Weiss, director of the Forest Products Laboratory at Madison, Wile. Picture, diagrams, and tables are omitted.

In 1907 the American Railway Engineering Association sent out a number of letters asking various railroad engineers what per cent of their ties failed from decay and what per cent from mechanical destruction. The replies in general were that about ninety per cent of oak ties failed because of decay, as against twenty-five per cent of cedar. In other words, the mechanical destruction of the ties varied from a minimum of about ten per cent for oak to a maximum of about seventy-five per cent for cedar. The many good results which have been and are being secured by timber treating engineers in protecting ties from decay are placing each year a larger per cent of our ties in the cedar class in so far as their mechanical life is concerned. This means that the problem of mechanical protection is one of increasing importance. It is a waste of preservative, effort and money to inject into ties an amount of preservative which will protect ties beyond their mechanical life because after the tie has once failed mechanically it is removed from the track and destroyed. With costly treatments, particularly such as are given by the full-cell creosote process, this problem is of immense importance to railroads, as it may mean a waste of hundreds of thousands of dollars yearly. If the tonnage of the road is light, as with many traction companies, the arguments here advanced for tie plating and more expensive fastenings are not of such immediate importance. In fact, in such cases it may often prove inadvisable to tie plate, especially if the ties are made of a hard wood. In this paper I wish to discuss briefly the protection of ties from mechanical causes of failure and will not go into the subject further than to indicate certain points of interest to timber treating and railroad engineers. By the mechanical destruction of ties I mean rail wear and spike cutting.

The protection of ties from rail wear is secured by means of tie plates. These serve two primary functions: (1) The protection of the tie from the crushing and pounding action of the rail due to the passage of rolling stock; and (2) the protection of the tie from the grinding action of the rail caused by its tendency to creep and vibrate.

A great variety of plates has been advocated to protect ties from destruction. They may be classed, however, as wood and metal plates. The former are rather extensively used abroad, and are also under test in this country. From the experience which we have had with then in different test tracks laid in co-operation with American roads, the results have not thus far been satisfactory. Wood plates offer little or no reinforcement to spikes when these are subjected to a lateral thrust; consequently, spikes are more likely to bend and rail spreading is likely to occur. Furthermore, the plates often tend to work loose from under the rail and if spikes are driven through them they split badly. In some of our tests, where wood plates were attached to the ties, they actually became imbedded in the ties. If the tie is slotted so that the plate can be inserted in such a manner that its upper surface will be level with the top of the tie many of these objections are overcome, but this method of treatment increases the cost of preparing ties for service and also weakens them.

More satisfactory results have thus far been secured, in our experiments at least, with metal plates. These vary considerably in

form, but may be classed into two types, viz., pronged or ridged plates and flat plates. The object of the former class is to imbed the plate in the tie, thus making it a part of the tie and assisting the spikes in resisting rail spread. The chief disadvantage we have noted to this type of plate is its tendency to gouge into the wood and at times completely destroy it. The untreated interior of the ties is thus exposed to the weather and decay is readily admitted. Flat plates do not have this objection, but are troublesome at times in that they become loose and rattle under the rail. Furthermore, they simply rest upon the tie and offer no reinforcement to the spike against lateral thrust.

A feature in tie-plate construction which has perhaps not been given the serious attention to which it is entitled is the size of plate for the kind of tie on which it is to be placed. A light. small tie-plate is of little or no value in protecting the tie from destruction. It is necessary to have the plate of sufficient surface area so that the crushing action of the rail will be distributed as widely as possible, and to have sufficient thickness, so that no buckling will occur. As is generally known, the various woods which are now manufactured into crossties differ very appreciably in hardness and in crushing strength. Cedar, loblolly pine, etc., are considerably weaker than black locust and white oak, for example. If cedar ties are interspersed in a track with white oak ties and the same sized tie-plates are placed upon both, the cedar ties are going to fail from mechanical destruction far more quickly than the white oak ties. That track is best laid which makes each tie carry its proportionate share of a passing load; therefore, to secure best result, tie-plates should be so designed that the unit loads placed on various kinds of ties will be approximately the same. Perhaps best results are secured by placing in the track ties of uniform hardness, at least in given stretches.

The Forest Products Laboratory has made over 2,000 tests on about seventy species of timber to determine their resistance to crushing when the force is applied at right angles to the grain as in the case of crossties.

I have taken as my standard for comparison with other woods a white oak tie. A number of woods are stronger than white oak, and hence the size of tie-plate which they would require would be smaller than that required by white oak. On the other hand, most of the ties have a less crushing resistance than the standard white oak tie, and for this reason require larger plates. There is a fixed relation between the specific gravity or dry weight of the wood and its strength; in other words, woods which are light in weight are low in crushing resistance, while woods heavy in weight offer considerable resistance to crushing. It might be claimed that this property of hardness or strength should be considered in fixing the price of crossties; that is, ties which have a low crushing strength, and which consequently require a large-sized tieplate in order to be protected from mechanical destruction, should, other things being equal, sell at a lower price in an untreated condition than similar ties which are heavier and which offer greater resistance to mechanical destruction. If this principle were carried out in practice it would result in some cases in a readjustment of tie-plates. It is felt that such a readjustment is warranted from the standpoint of efficient track maintenance.

The question has frequently arisen, "What effect have the different preservative processes upon the strength of ties?" This matter has been investigated by Dr. W. K. Hatt at Purdue University. The difference in strength between treated and untreated ties, except in the cases of those treated with crude oil, is so slight as to make this a matter of little practical importance. Of course, this statement assumes that the ties are properly treated and not injured by excessive heating or other causes.

The function of spikes is to hold the rail to the tie, which, analyzed, means that they must exert a resistance to pull and resistance to lateral thrust, the former resulting from the so-called "bumping" of the rail, the latter accentuated by the centrifugal force exerted by the train in rounding curves. As in the case of plates, a great many methods have been advocated for fastening rails to ties. The Patent Office is filled with devices aiming to secure this apparently simple end. I cannot even attempt to consider all of the various schemes advocated but will call your attention to three types of construction in more or less extended use. These involve the use of the cut spike, the screw spike, and the dowel.

The cut spike is by far the one most generally employed in this country. It is cheap, enables a quick laying of the rail, and is casily applied. When freshly driven in sound, heavy timber it also gives very satisfactory results. It has, however, been subject to severe criticism because it frequently becomes loose in ties and under such condition may cause an unsafe track. This feature has led to considerable experimenting in an effort to overcome these disadvantages.

The screw spike has been most successful thus far in removing the chief criticism levied against the cut spike, viz., its low holding power. Screw spikes, however, are more costly than cut spikes and more difficult to insert in the track. Their use, however, is growing and will doubtless continue to do so, as this form of spike possesses considerable merit. In a large number of tests made at Purdue University, a part of which were conducted by the Forest Service, it was found that screw spikes had from 1.7 to 3.8 times the strength of common cut spikes against pull, and from 1.2 to 2.4 times the lateral resistance of the common spike. In round numbers one screw spike is about as efficient as two cut spikes so far as holding the rail to the tie is concerned.

The large number of ties cut from comparatively soft woods, such as loblolly pine, have encouraged certain roads to experiment with hardwood dowels. These are simply plugs of hardwood, such as red oak, usually creosoted, screwed into the tie. The spike is then driven or screwed into this hardwood dowel. By this method a very firm grasp of the rail to the tie is secured, and should the spike become loose and worn, the hardwood dowel can be unscrewed from the tie and a new one inserted. Of course, such a method of treatment is expensive; and, furthermore, it has a disadvantage in that it weakens the tie unless the ballast is kept in very good condition. Where it has been put to practical test this method has, however, yielded very satisfactory results.

This is a feature of preparing ties for service which is also of comparatively recent origin in this country. As by far the larger majority of crossties now in use are hewn, the problem of securing a uniform bearing of the rail or tie-plate on the tie is of great importance. Unfortunately, common practice in this country consists in adzing such ties after they have been treated. This removes the preserved layer of wood at the very point where its protection is most needed. In order to secure best practice it is absolutely essential to have the rail or tie-plate bear uniformly on the tie and unless the ties are adzed this result is rarely accomplished. Adzing is, therefore, strongly recommended, particularly on hewn ties, and the proper time to adze is before the ties are treated, and not after. While the mechanical adzing of ties is still in its infancy, it is quite likely machinery to do this work will become a part of the well-equipped tie-treating plant.

Another feature in too limited use at present is the boring of the ties for the insertion of spikes. When screw spikes are used it is absolutely essential to bore a hole into the tie in order to insert them, and if this hole is bored after the tie is treated the unprotected interior is more or less exposed to decay. Boring should, therefore, be preferably done before the ties are treated. Even with the ordinary cut spike, boring is of direct value. The spikes driven into a hole three-eighths inch in diameter has a greater holding power than spikes driven into the tie not bored. This is due to the fact that when a spike is driven into a bored tie the fibers are not crushed to the same extent as when no boring has been made.

The following general conclusions can be drawn from this paper:

(1) The increasing number of treated ties being used in this country is increasing the importance of protecting them from mechanical destruction because the problem of protection from decay is being rapidly solved. To secure best results, therefore, a protection of treated ties from rail and spike cutting is strongly recommended.

(2) It is believed that, other things being equal, the size of the tie-plate should depend upon the kind of tie with which it is to be used. Soft ties demand a larger plate than hard ties. It is felt that this fact should be recognized in fixing upon the price of various timbers for crossties.

(3) Preservative treatments with creosote and zinc chloride when properly made affect the strength of ties so slightly that any difference in crushing value is of little or no practical importance.

(4) On account of their holding power screw spikes are preferred to cut spikes and can be recommended where high-class construction is desired.

(5) Adzing and boring ties, particularly the adzing of hewn ties, prior to treatment, is considered of prime importance in preparing them for service. Adzing after treatment should be classed bad practice, as it exposes or tends to expose the interior of ties to decay at a point where protection is most needed.

The Value of Wood Structure Investigations

The study of wood structure which is sometimes referred to as xylology, has slowly but surely taken a definite place in the courses of study in the forest schools in this country. Although work has been done only on the most important native woods now in the markets, it is destined to receive considerable attention as the trade with foreign woods increases. Over two hundred kinds of timber from foreign countries are sold in this country and the question often arises as to the correct name and source of these different kinds. If the botanical specimens (leaves, fruit, and flowers) of the trees from which these woods are derived could be readily procured, it would be a comparatively easy matter to trace down their names by referring to botanical works in which such species are described. With reference to the woods alone it is an entirely different and often a more difficult task. Only a few of the commercial timbers have been thoroughly described and classified according to characters visible to the unaided eye and under the microscope. As the work progresses the various timbers of commerce will be described in detail and analytical keys worked out. These descriptions will be of inestimable aid in tracing down their correct names. The possibilities of this work are beginning to be realized and the activities by a few investigators indicate the growing importance of the subject.

The subject can no longer be regarded as a part of a course in botany or plant histology, but must in the future be treated, studied, and taught as a distinct branch of science. It is of the utmost importance that all well equipped students of botany, forestry, and related lines of work should be acquainted with the main facts of wood structure. Too much stress cannot be laid on the importance of a knowledge of wood structure to those who have to do with timber preservation, wood pulp industry, tie and timber inspector, contractor, and others. This importance is, however, further enhanced in the work of identifying wood by the structure, in which case it is not only paramount but fundamental.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Misil Bag nepartment, the Fig. WOOD RECORD, 537 South Deapborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envolepe.

B 648-Wants Kiln-Dried Gum Flooring

New York, N. Y., Jan. 27. Lditor Hymbwoon Recomb: Will you kindly send us a list of the manufacturers of kiln-dried red gum flooring, and oblige.

This concern has been given the names of a few manufacturers of the stock sought. Anyone interested may have the address upon request.—EDITOR.

B 649-Seeks Canadian Birch

Philadelphia, Pa., Jan. 28. Editor Hardwood Record: Could you turnsh us with the names of any Canadian mills who could furnish us 4/4 No. 1 common and better birch which would come to Philadelphia on an advantageous rate?

A list of Canadian mills producing this material has been supplied the above inquirer. Any Canadian manufacturers having birch to offer as specified, and desiring to be placed in communication with this possible customer, will be supplied with the address upon application.—EDITOR.

B 650-New York Mahogany Dealers

Vancouver, B. C., Jan. 18.—Editor Hardwood Record: Would you be good enough to give us the names of say, three of the largest mahogany dealers in New York City? Thanking you in anticipation.

The information asked for has been supplied .- EDITOR.

B 651-In the Market for Cherry

Cincinnati, O., Jan. 13.—Editor Hardwood Record: We wish you would kindly favor us with the names and addresses of mills manufacturing cherry in eastern Tennessee, Kentucky and West Virginia.

Thanking you in advance.

The names of cherry manufacturers in the territory mentioned have been forwarded to the above correspondent. Anyone in the states referred to having cherry to offer may have the address of the inquirer upon request.—Editor.

B 652-Seeks Auto and Buggy Bows

Cape Girardeau, Mo., Jan. 12.—Editor Hardwood Record: Can you furnish me with a list of names of the makers of oak or ash automobile and burger bows?

A list as requested has been compiled and forwarded our correspondent. Anyone interested in getting in touch with above, can have the address by writing this office.—EDITOR.

B 653—Wants Persimmon

Kinghorn, Fife, Scotland, January 17.—Editor Hardwood Record: We would like a list of persimmon producers. Thanking you in anticipation of your early attention to this matter.

This concern is a manufacturer of golf heads and clubs and wants this stock undoubtedly for its golf heads. Any concerns or individuals desiring information necessary to get in touch with this party can have it upon application to Hardwood Record.—Editor.

B 654—Regarding Cottonwood Panels

A recent issue of the Mail Bag department contained an inquiry for cottonwood panels for trunk work. After investigation HARD-WOOD RECORD printed the inquiry and in commenting on it said that cottonwood had not been used because of the difficulty in slicing it after steaming and the fact that it was difficult to glue it up without it having been steamed.

HARDWOOD RECORD is in receipt of the following communication, which rather refutes this suggestion:

Sedro-Woolley, Wash., January 23.—Editor Hardwood Record: In the January issue of your paper we note in the Mail Bag department that you have a subscriber inquiring for built-up cottonwood panels and we note your reply.

In this connection we wish to state that we are large manufacturers of this material and inasmuch as you state you have never seen any of this wood glued up, we are mailing you under separate cover a sample of the trunk stock which we make from cottonwood. We do not steam cottonwood before gluing but cut it cold, air-dry for two or three weeks, then run through our dry-kiln and glue up the same as we do our fir panels. We are using a vegetable glue in our glue room.

We are selling this material to trunk manufacturers on the Pacific coast and would be glad to have the address of the party wishing this material as we have a San Francisco representative and also one at Los Angeles.

The Strong Vinnin Company of the Pacific Coast.

HARDWOOD RECORD has received the sample referred to and it certainly looks to be first-class in every way.—EDITOR.

B 655-Wants Soft Maple

Philade'phia, Pa., Jan. 30. Editor Harmwoop Rissian: We have been reading your book entitled "American Forest Trees," and we see on page 430 in the description of the silver maple or soft maple that the "largest trees and the best wood grow in the lower Ohio valley."

We should like you to put us in touch with several or more reliable firms upon whom we could depend for at least three cars per year running for a term of years, for the following kind of 10/4 soft maple. We know you have index cards but rather than go thru them we would prefer you to send us information of several concerns. The cost of this we would be willing to pay, and we hope you have something ready to hand which you can give us.

Soft maple—all 10/4. In the groups of 10%-90%—can be all one size

```
21." wide, 57" long
5" wide, 57" long
5" wide, 11" long
21.2" wide, 11" long
8" wide, 10" long
8" wide, 10" long
```

8" wide, 10' long

5" wide, 16' long \90%. Absolutely clear-no defect

5" wide, 10' long 8" wide, 57" long

Can also be red gum if dry and perfect—no checks or warp.

Anyone wishing to be placed in communication with above inquirer may have the address on application.—Editor.

B 656-Seeks Soft Maple

New York, N. Y., Jan. 30.—Editor Hardwood Record: We are anxious to find some 10/4 No. 1 common soft maple in a hurry, and would thank you very much to put us in touch with anyone whom you believe might have this stock.

The names of manufacturers of the stock desired has been supplied our correspondent. Those having soft maple to offer may have the address by writing this office.—Editor.

Clubs and Associations

United States Chamber of Commerce to Hold Meeting

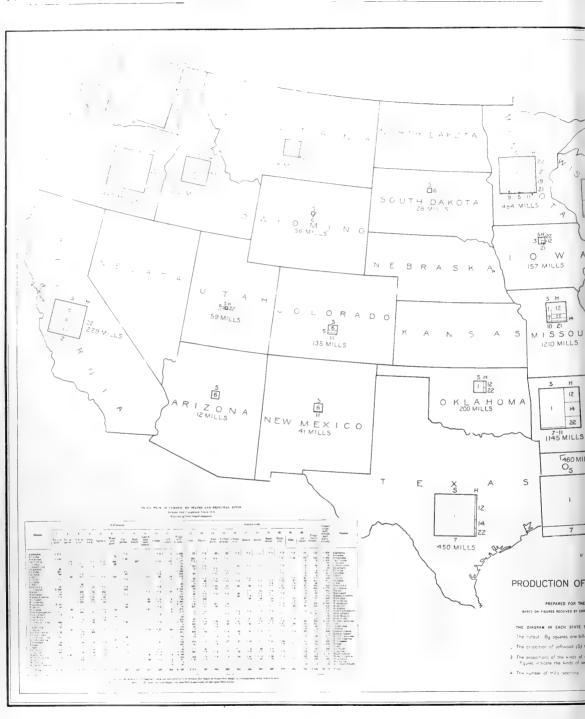

The second annual meeting of the National Chamber of Commerce will be held in Washington, D. C., February 11, 12 and 13. It promises to be a meeting of the greatest importance, and will be attended by many prominent men. It comes immediately subsequent to the declarations of the administration relative to various methods of corporate control. During the sessions the main features of corporate activity will pass under the scrutiny of the business men of the nation. The moment is crucial in the nation's business history, for corporations represent more than 300,000 business enterprises with over \$61,000,000,000 worth of stocks and over \$34,000,000,000 worth of bonded and other obligations, and touch every phase of the developmental activity of the nation.

Two entire days at the second annual meeting of the Chamber of Commerce of the United States, to be held in Washington, February 11 to 13, will be given to the subject of anti-trust legislation and the maintenance of resale prices. Anti-trust legislation will be discussed February 12. The concentration of industry in the United States will be taken up first, The respects in which the Sherman law requires definition will be part of this discussion. Second, the abolishment of holding companies and of interlocking directorates will be considered. Third, the rights and privileges of private parties in invoking the aid of the Sherman law will be set forth. Fourth, the functions of a Federal Interstate Trade Commission will be discussed. The fifth point to be discussed is as to whether the trust form of organization is industrially efficient. Among the speakers will be President Charles R. Van Hise, University of Wisconsin; Louis D. Brandeis of Boston; Frederick P. Fish, former president of the American Telephone and Telegraph Company; Victor Morawetz of New York City; Prof. Henry R. Seager, Columbia University, N. Y.; Henry R. Towne, president of Yale & Towne Manufacturing Company, and former president of the Merchants' Association, New York City.

On February 13 the question of maintenance of resale prices will be opened for discussion by the Hon. Joseph E. Davies, Commissioner of Corporations. William H. Ingersoll of R. H. Ingersoll & Bro., and Donald Dey of Dey Brothers & Co., Syracuse, N. Y., will present two phases of the question.

At this annual meeting James G. Cutier of the Cutler Mail Chute Company, Rochester, N. Y., as general chairman of the standing committee on patents, trade marks and copyrights, will present his report.

(Continued on page 36.)

Lumber Output for 1912

The accompanying map, which gives the output of lumber by states and by species in the United States for 1912, was sent out by the United States Forest Service, as the first detailed announcement of the cut of lumber for that year. A brief summary was published a few weeks ago. A fuller report, with discussion of the figures, is promised for the near future by the Census Bureau.

The lumber total for 1911 was 37,003,000,000 feet, and for 1912 was 39,155,000,000, a gain of 2,155,000,00, or nearly six per cent. The increase was fairly well distributed over the country, with no large advance or marked fall-

The number of sawmills reporting in 1911 was 28,107, and in 1912 was 29,648, which shows an increase in mills of nearly six per cent. It thus appears that the increase in lumber and in mills corresponds almost exactly. In neither year were mills tabulated actly. In neither year were mills tabulated which did not show a yearly output above 50,000 feet. Those omitted may have numbered several thousand, but had their aggregate cut been included the effect on the total would have been inconsiderable. The average output per mill in 1911 was 1,318,000 feet, and in 1912 it was 1,320,000—only 2,000 feet difference.

The average cut of lumber per mill varies greatly, when different states are compared. The highest average is found in Arizona, the lowest in New Jersey. An examination of the table which follows reveals the fact that the average cut per mill is higher in the softwood regions than in those where hardwoods prevail. Softwood mills are larger, and the total stand of softwoods in the whole country is believed to be about six times as great as the stand of hardwoods. The table below gives the average yearly lumber cut per mill in the different states in 1912.

Pennsylvania Lumbermen Hold Annual

The (wint) second annual convention of the Pennsylvania Lambert, and Association was beed in the Intel Wilton, Philadelphia, on January 28 and 29. After the face any of committees and board of directors, the convention was called to order at 2.19. M, on January 28 by President J. J. Millelsen of Mechanicsburg. After the roll call and the reading of the annual reports of the officers, the following topics were discussed. The La ht 19 hayer Ena of the Business; The Average Demurrage Agreements; Our National Forests, and Local Associations.

On January 29, at 9–15, the delegates, by invitation of the Curtis Pub-Hishing Company, were escorted through Its plant, a privilege and compliment which was much appreciated. The second session of the meeting was called to order at 10–30, at which the subject of Modern Road Building was discussed. Justin Peters, manager of the Pennsylvania Lumbenee's Mutual Fire Insurance Company, then gave an emphasized talk on the advantages of mutual fire insurance companies. He was followed by the reading of the reports of the various committees. The election of directors then followed, and Henry Palmer, Langhorne; William S. Goff, Wilkes-Barre, and Theodore A. Mebl, Rosemont, were voted in for three years. The board of directors later re-elected J. J. Millelsen, president; Theodore A. Mebl, vice-president; T. J. Snowden, treasurer and J. Frederlek Martin, secretary, which closed the business session.

A moving picture was then thrown upon the wall of the hall, through the courtesy of the Long-Bell Lumber Company, illustrating the lumber mdustry from the felling of the tree to the shipping of the lumber to the trade. At 1 p. m. 260 members of the association and their friends sat down to a sumptuous dinner. President Milleisen acted as toastmaster. Speeches were made by Hon. M. Clyde Kelley, congressman from Plittsburgh, who spoke on association work; Hon. Gifford Pinchot, who gave an interesting talk on forestry, and Hon. Charles R. Miller, governor of Delaware, who impressed upon the boys the necessity of a harmonious get-together spirit in trade. This wound up the most interesting convention in the history of the association.

The committee in charge of the entertainment was composed of Henry Palmer, chairman; C. Frank Williamson and Benjamin Stokes. The souvenir of the occasion is an artistically gotten up booklet in green and gold, the front cover inlaid with a square of highly-polished maple wood. It contains the names of the officers and the speakers, the menu, and photos of the officers and speakers, and was donated by the Pennsylvania Lumbermen's Mutual Fire Insurance Company, Philadelphin; Lumbermen's Mutual Fire Insurance Company, Mass.; Lumbermen's Mutual Insurance Company, Mansfield, Ohio; Indiana Lumbermen's Mutual Insurance Company, Indianapolis, Ind., and the Central Manufacturers' Mutual Insurance Company, Van Wert, Ohio.

Forest Products Exposition Bulletin

With the approach of the Forest Products Exposition, which is to be given at the Coliseum, Chicago, April 30-May 9, and the Grand Central Palace, New York. May 21-May 30, indications point to one of the most important, popular, attractive and result-producing industrial expositions that has ever been held in America. Reports and reservations of space from every section of the country and branch of the industry bear out the report of the management that every phase and part of the American

wood industry will be well represented and forming the great shop window of the industry, which is the fundamental purpose and ambition of the undertaking.

During the past two weeks some of the most important details of active participation have been decided upon definitely. Contracts are being let by the principal lumber manufacturing associations for their respective exhibits of the utility, possibilities and general advantages of their particular productions, while individual exhibitors are engaged in more or less elaborate preparations. At recent meetings several branches of the hardwood manufacturing industry have appointed committees with power to act toward representation; at the annual meeting of the Hardwood Manufacturers' Association of the United States the tight stave manufacturers took steps to cooperate with the slack stave manufacturers. the oak manufacturers decided on a definite plan to exhibit, the vellow poplar manufacturers decided to secure representation, and several other branches of the hardwood industry took up the matter with definite purpose. At the same time the American Wood Preservers' Association, at its meeting in New Orleans, appointed a committee with power to act, and space was secured at both Chicago and New York for an extended display, while the committee was authorized to undertake to secure joint display with the paving block manufacturers.

Among other reservations that have been decided upon are E. C. Atkins & Co., Clyde Iron Works, Barrett Manufacturing Company; Seattle Ceda Lumber Manufacturing Company, Mossman Wood Turoing Company, and a number of others, while more than fifty individual manufacturers, producers, specialty concerns and organizations have practically closed for their representation. The space has been allotted for the forestry division of the United States Department of Agriculture for an extensive and most comprehensive demonstrating exhibit of the operations of this service in research and testing.

With the Trade

Robert F. Whitmer Banquetted

Robert F. Whitmer, the well-known and popular head of the extensive lumber house of William Whitmer & Sons, Inc., has abundant reason to remember with pleasure his fiftieth birthday, which fell on Sunday, January 25. To commemorate it, 125 of his employees and business associates tendered him a complimentary dinner in the north garden of the Bellevue Stratford hotel, on the evening of January 24, which proved one of the happiest and most enjoyable social reunions in the history of the company. The decorations for the occasion were elaborate and artistic and the music of the choicest, as everybody was eager to show his appreciation of the pleasant relations which have always existed between employer and employee of this house. R. S. Coryell acted as toastmaster, and a number of acceptable speeches were made. A pleasant surprise awaited Mr. Whitmer, when F. H. Ely, in a neat and appropriate speech in behalf of those present, presented him with a handsome loving cup suitably inscribed. Mr. Whitmer acknowledged this token of respect from his employes and business associates in a speech which the boys pronounced a dandy. There is nothing that will bring about so effectually

L. W. CROW

F. J. PIKE

GEORGE J. POPE

On January 26 the board of directors of the Lumbermen's Association of Chicago held a meeting at the association headquarters and elected the following officers for the ensuing year: L. W. Crow. president, Francis J. Pike, vice-president, George J. Pope, treasurer, E. E. Hooper, secretary.

the much preached efficiency in all basine's department as cordial and friendly relations between the heads and their faithful subordinates, the truth of which proposition, it is needless to say, Mr. Whitmer has made a successful test.

A Big Arkansas Incorporation

The Sanitary Veneer and Barrel Company is the name of a new \$500,000 corporation recently organized in Little Rock. This company filed articles of incorporation with the secretary of state on January 31, and shows a capital stock of \$500,000, with H. I. Cutsinger of Indianapolis as its president; W. M. Kavanaugh of Little Rock, vice-president and treasurer; W. D. Cammack of Little Rock, secretary; Chris Ledwige, L. L. White and A. C. Read, all of Little Rock, are the other members of the board of directors.

This new concern purposes to erect a large manufacturing plant in the Factoria addition to Little Rock within the next ninety days. It comes to Little Rock as the result of negotiations on the part of A. C. Read and the Little Rock Chamber of Commerce. The Factoria Land Company, of which A. C. Read is general manager, donated a ten-acre tract in the Factoria addition, and the Chamber of Commerce has entered into an agreement to pay five per cent of the company's pay roll during the next two years, provided the company will employ more than 200 men, and provided further that the amount thus paid out by the Chamber of Commerce during the period will not exceed \$20,000.

It is the plan of the new company to erect a plant of such capacity as to employ from 400 to 600 men, with a daily capacity of 40,000 barrels. The company will manufacture a new form of veneer barrel. This barrel is said to be stronger, neater and more compact than the old style barrel, and is also so arranged that it can be readily shipped in a knocked down form, thus saving freight charges. The new barrel will be cylindrical in form, built of three-ply veneer, with a metal hoop in the center to give it strength.

Yeager Lumber Company Organizes at Buffalo

The organization of the Yeager Lumber Company, Inc., was completed on February 2 with the following officers and stockholders: Orson E. Yeager, president; F. G. Yeager, vice-president; C. A. Yeager, secretary; P. N. Yeager, treasurer. The last three men are brothers of Orson E. Yeager and have been associated with him for several years past in the administration of his business as Orson E. Yeager. The directors of the new company are F. G. Yeager, P. N. Yeager and Orson E. Yeager.

The Yeager Lumber Company, Inc., has purchased the entire stock, yard and equipment previously owned and operated by I. N. Stewart & Bro., 892 Elk street, Buffalo, which property adjoins the present location and provides the company with an exceptionally large and complete assortment of dry hardwoods with increased yard and shipping facilities. The capital stock of the company is \$200,000.

Death of DeWitt G. Courtney

The death of Dewitt G. Courtney occurred at his home at Charleston, W. Va., on January 29, 1914, in his sixty-sixth year. He was widely known as a business man and had tie, lumber and stave mills in Lincoln, Putnam, Kanawha, Boone and Greenbrier counties, West Virginia, and in Bath county, Virginia. At the time of his death he was president and largest stockholder in the Courtney Company. Mr. Courtney was also interested in oil, gas and coal in a number of West Virginia counties. On account of failing health he retired from active business about a year ago. The immediate cause of his death was Brights' disease.

He was born at Grove City, Pa., December 15, 1848. He remained there, engaged in the lumber and stave business, until 1884, when he removed to West Virginfa, where he took up the same line with great success. He was never married, and is survived by four sisters and two brothers: S. P. Courtney and T. E. Courtney of Charleston, W. Va., and Mrs. G. D. Roberts of Memphis, Tenn.; Mrs. Nancy R. Ulen of Grove City, Pa.; Miss Amanda and Miss Mary C. Courtney of Charleston.

The funeral services were conducted by Charleston Lodge 202, B. P. O. E., at his late residence, and the Interment took place in Woodland cemetery at Grove City, Pa., after appropriate services at the Grace M. E. Church at that place.

Joins Forces of the Simonds Manufacturing Company

The Simonds Manufacturing Company, Fitchburg, Mass., and Chicago, Ill., announces that William Miller, who recently discontinued his connection as secretary of Henry Disston & Sons of Philadelphia after a service of thirty-seven years with that concern, has become affiliated with the former institution. Mr. Miller is one of the most experienced and efficient men in the saw, knife and file-making business and it is quite likely that no man is better known or more favorably thought of among the thousands of hardware dealers and sawmill men throughout the United States and Canada. He has been successful throughout his many years in the saw-making industry and brings to the Simonds Manufacturing Company his good will, energy, enthusiasm and a conscientious desire to see that the customers of this company are always furnished with goods of the highest quality. He has already taken up his new work in the executive offices of the Simonds company at Fitchburg.

Interior Finish Plant Being Overhauled

The work of overhauling and repairing the interior finish plant of Henry S. Koppin of Fenton, Mich., is being pushed rapidly and it is expected that machinery will be in operation very shortly. A. C. Standart, general manager of the company, states that the contract for new machinery has been let and that the machinery will soon arrive. The company has already purchased considerable lumber for operation.

Thornton A. Green Retires

Thornton A. Green, manager of the Greenwood Lumber Company of Ontonagon, Mich., sold out his interest and retired from that company at the annual meeting held at Houghton. C. H. Worcester, who has been associated with him since the summer of 1908, purchased Mr. Green's interest. At the same time Mr. Green purchased of the company all of its many thousand acres of cut-over lands and all that will be cut for some years to come. It is his intention to go into the land and timber business and he will more than ever devote his time to the development of Ontonagon county.

Mr. Green went to Ontonagon in 1900 to take charge of the sawmill of B. M. McMillen. The mill had just started to saw lumber and was one of the first to saw hemlock lumber in quantities in that district. The firm name changed in 1900 to C. B. McMillen & Brother, and a few years later to the C. B. McMillen Company, at which time Mr. Green bought a quarter interest and became general manager. The Ontonagon railroad was built by him and his associates in 1903. Mr. Green has been president and manager ever since and will still remain as president of the road. In 1908 Mr. Green bought out the McMillen Brothers and organized the company under the present style, Mr. Worcester becoming interested with him at that time. Mr. Green became secretary and general manager, which position he held until his retirement.

THE LATE DEWITT G. COURTNEY, CHAR- THORNTON A. GREEN, ONTONAGON, MICH. ORSON E. YEAGER, FRESIDENT YEAGER LUMBER COMPANY, INC., BUFFALO, N. Y.

where the litter of the litter of the with Mr. Worker that C. M. Worker and L. W. C. H. Worker Francisco Company at Chassell, Mich.

Atkins Pioneers Dine

The Atkins Poincers, an organization of employes who have been associated with E. C. Atkins & Co., the saw manufacturers of Indianapolis, for twenty years or over held the fifth annual banquet at the Spencer House on January 31. Thomas F. Sorry was general chairman in charge of the function; C. S. Bronson was chairman of entertainment; C. A. Newport, chairman of binance; Lotus Farmer, chairman of music; C. A. Newport, chairman of the programs; and W. O. Williams, chairman of the nominating committee. Those in attendance enjoyed an excellent dinner and a vivious in the organization which consisted of Amedo, available to and buttons solus selection performances and reclations.

This function has been featured by the Atkins company as a recognition of the Lathial services of its many old employes. The member hip lathern held up very steadily and it is interesting to note that twenty beyons ago the entire payroll of the Atkins plant was about 200, and of this 200 117 are still connected with the company. There have been, of course, the usual number of deaths while in the company's service. The roster has been shortened by the loss of seven men during the past year.

The ploneer gatherings are occasions for the full enjoyment of good fellowship and hearty fraternal spirit. They are a visible demonstration of the spirit which the Atkins concern puts into the manufacture of its various lines of goods and for which the company has been noted in its dealings for many years.

Veneer Concern Moves to Minnesota

Articles of incorporation of the Northern Veneer Company were their recently, authorizing that company to start operations at Deer River, Minn. This is a concern removing from Spring Valley, Wis, and its now building its plant preparatory to starting operations early in the spring. The incorporators are Thomas B. Wilson, Frank Pierce and Frank Carter of Menomonie, Wis, William Bahr and Roland Bahr of Deer River Minn. The capital stock is \$25,00.0.

W. D. Reeves Killed in Automobile Accident

Coionel William Dixon Reeves, head of the W. D. Reeves Lumber Company of Helena, Ark., one of the best known and most popular of the southern bardwood operators, was instantly killed at noon on Tuesday, February 3, near his bone in Helena. Mr. Reeves was leaving his residence with his son Dixon in his touring car, starting on an after noon's hunting trip, but owing to the slippery condition of the roads, the machine began to skid badly. At the corner of Beech and St. Mary's streets it finally went over the edge of the steep incline and overturned, Mr. Reeves being caught beneath the steering wheel and very badly crushed. The son was picked up from the ditch badly shaken up but unhurt and the father was rushed to his home, where he died thirty minutes later in the presence of his family.

Mr. Reeves began his career in the lumber business about twentyfive years ago, locating at that time in Arkansas. His first sawmilling experience on his own responsibility started sixteen years ago when he began operating a mill at Helena in 1897. Since that time his operations have been gradually widening until he has at present attained a very prominent position among the ranks of southern hardwood operators.

The lumber trade in Chicago, because of Mr. Reeves' close association in this city, and also the trade in other prominent centers, will join with the city of Helena in the sincere expressions of deep regret at his untimely death, which occurred in his fiftieth year.

Mr. Reeves leaves a wife and four children, one daughter, Louise, being away at school. The other three children are Dixon, aged fourteen: Frank, aged ten, and Elizabeth, aged seven, who were all present when their father passed away.

Boyne City Lumber Company Elects Officers

The annual meeting of the Boyne City Lumber Company, Boyne City. Mich., was held on January 27 in the Michigan Trust building, Grand Rapids, the following officers being re-elected: William H. White, president; Thomas White, vice-president; W. L. Martin, secretary; Henry Ideam, treasurer. The directors are Louis H. Withey, Amos Musselman, George M. Barr, Claude Hamilton, Henry Idema, William H. White, and Themas White.

With the Exporters

Among the matters discussed at the annual meeting of the National Lumber Exporters' Association, held in Chicago, January 22 and 23, was the question of the Liverpool measurement. As stated in an advance article on the meeting, the Liverpool measurement has become as trouble-some a matter as the London dock rules and their interpretation proved to be. In the case of the London dock rules, the National Lumber Exporters' Association finally, after a vain endeavor to get the foreign buyers to attend a conference with a special committee sent over to London for the purpose, drew up an agreement wherein the signers bound themselves not to ship except on the basis of the American rules, which agreement was signed by upwards of seventy per cent of the exporters. At the time the London rules were taken up the Liverpool measurement had

not attracted any particular attention, but since then the question has become a vital one, and occasioned much discussion at the meeting, which decided to refer the matter to a special committee yet to be appointed for recommendation. It is thought that Gustave A. Farber, the London representative of Russe & Burreses, Inc., Memphis, will be asked to make representations to the Liverpool buyers in the interest of the National Lumber Experters' Association, just as he did with regard to the London bock rules. If the Liverpool buyers persist in their present attitude it is altogether probable that some agreement similar to the one adopted with regard to London will be entered into.

Through bills of lading also came in for extended consideration, but no instance in was taken. The bill now before Congress, and whileh is known as H. R. 9771, was discussed in all of its bearings. It requires the rathroads to issue and the steamship companies to recognize through bills of lading. The association did not actually indorse the measure, being disposed to consider it further and to await other developments, but it is felt that an effective solution of the problem lies in some degree of control over the foreign steamship companies, so that they can be held liable for flagrant disregard of contract requirements when it comes to taking lumber and logs within a reasonable time. At the present time the steamship lines avoid liability for demurrage, when cars are held loaded for an unlimited period, by the simple expedient of refusing to recognize through bills of lading, to the great embarrassment of the shaper.

C. L. Willey Makes Unusual Mahogany Purchase

t L. Willey of Chicago announces that at the recent February mahogany sales held at Liverpool his buyers made purchases that aggregate one of the largest and most remarkable mahogany buys in the history of the mahogany business. Mr. Willey's representatives took up a total of 126 manogany logs of unusually large size and exceptional quality. These logs will aggregate about 1,200,000 feet of mahogany. They are already en route to Mr. Willey's immense plant at Chicago and it is expected that some exceptional veneer will result from their manufacture. This is another one of the unusual purchases for which Mr. Willey has become noted during his career as a manufacturer of fancy wood veneer and lumber.

An Unusual Plant at Philadelphia

It is well worth the time, whether intimately connected with the industry or not, to take a tip to the Westmoreland street wharves, where the Pearson & Ludischer Lumber Company, manufacturer and wholesaler, at its fifty acres of ground, with mill adequately equipped, carries on a manmoth lumber traffic. Several hundred million feet of lumber can be stored on these grounds and still large spaces left. It has two concrete plets, one 110 by 641, the other 83 by 641 feet, with electric cranes and a twenty-seven feet depth of water, at which sixteen vessels can be unionated at the same time. Railroad connection is direct to the wharves. By the means of a car-level platform at the plant, a series of cars can be loaded with manufactured lumber at one time for quick shipment. Solid concrete reads intersect the grounds which much facilitate the hauling by motor or horse.

The company's new mill, which is now in operation, is elaborately equipped with the latest and most approved machinery from the American Woodworking Machinery Company: Two fast feed planers and matchers, 15 by 4 inches; one fast feed double surfacer, 30 by 4 inches; one 15-inch molder; one 18 by 20-inch four-sided timber sizer; one 54-inch band resaw; one 50-inch band rip saw; one 30-inch three-saw guage edger, level rolls, transfer, etc. The first three machines are equipped with specially designed automatic feeding tables, as they feed at the rate of 300 feet per minute-too fast to be fed by hand. The motor power is derived from four 250 horsepower safety water tube boilers, one 1,000 horsepower Corliss engine, and one 250 horsepower Turbo-generator. plant is lighted by electricity; which leaves nothing to be desired in the way of complete equipment. Visitors from distant parts of the country have been pleased to visit this model plant and have expressed themselves as surprised and edified by a trip through the grounds and mill under escort of the very courteous and obliging president, William L. Ludascher.

This company, with all its facilities for manufacturing and storing lumber, will be in the best of positions to handle the western product on the opening of the Panama canal. No essential preparation has been neglected toward this consummation. The other officers are Ralph Pearson, vice-president, and Paul P. Pearson, secretary and treasurer, both sons of Joseph T. Pearson, the wealthy box maker of this city. Mr. Ludascher is well known to the lumber trade, having been formerly a partner in Charles F. Felin & Co. This concern handles long and short leaf pines, white pine, hemlock, cypress of all sizes, dimension, etc., white and redoak, maple, hickory, etc.

Nineteenth Annual Pennsylvania Mutual

The nineteenth annual meeting of the Pennsylvania Lumbermen's Mutual Fire Insurance Company was held on January 27, President Edward F. Henson in the chair. There was a full attendance of members, who were gratified to find that in spite of a year of abnormally large fire losses the company has made a very satisfactory showing and is in a position to recommend a forty per cent dividend to its stockholders. Same officers were re-elected.

The president's annual report follows:

During 1913 the progress of your conjuny shows			
Increase of insurance in torce		- 8	1,525,085,17
Increase of premiums in force			28,556,78
Increase of net cash assets			20,984,66
Increase of surplus			6,706.27
Expiration return premiums pand in 1913 - 10 per cent			166,107.46
Losses incurred in 1913 41.58 per cent			-185,173.48
From organization-Lesses paid to Dec. 31, 1913		. 8	1,054,268,48
Expiration return premiums paid to Discust 1943			NOT, 982 76

Expiration return premiums poid to 10 of 1963. 877.98.776

The history of all fire insurance companies shows that certain years have proven to be years of loss, or at least years of less prosperity. The average loss ratio of this company for the nineteen years ending December 31, 1913, is 34.02 per cent of the premiums. The fires in 1913 were frequent, and our loss ratio was 41.55 per cent on a premium income of \$445.316.31. Only two years have we had a heavier loss ratio than in 1913—1900, of \$5.34 per cent loss ratio, and 1903, with 43.40 per cent. In the years 1898 and 1910 the losses were not so much above the average, amounting to 37.40 per cent and 10.22 per cent of the premiums. The year of our beginning, 1855, we passed without a loss, which was \$164.848.7. In 1901 our loss ratio was only 10.00 per normal premium income of \$52,236.46. In 1899, 1904 and 1906, our loss ratios were only 16.91 per cent, 21.06 per cent and 24.32 per cent.

We bring these facts to your attention that you may recognize insurance companies have their years of unusual prespectiva swell as years of heavy

companies have their years of unusual presperity as well as years of heavy

companies have their years of unusual presperity as well as years of heavy losses.

I am, nevertheless, very glad to report that, although we have suffered a depreciation of \$13,720.00 on our securities, made a 40 per cent saving upon all renewals during the whole of 1913, used 20.48 per cent for expenses, and paid out 41.58 per cent of the premiums written for losses, yet we have been able to add the sum of \$6,506.27 to our surplus, because of the additional income from our own investments and because of income from a specific very satisface placed through the office of Justine 1900 to 1900

the year 1914.

Pertinent Information

Building Operations in January

January makes a creditable showing in building operations. reports received by the American Contractor, Chicago, from 56 cities throughout the country show that building permits issued in those cities total \$37,152,920, as compared with \$40,361,949 for the permits issued in January, 1913. This is a decrease of 8 per cent, but the showing is an improvement over that for December, 1913, when 70 cities reported total operations of \$57,266,319. With a number of the larger cities yet unrepresented the total for the same cities in January will no doubt show a gain. Another interesting feature is that both New York and Chicago show rather notable losses. The loss for these two cities is greater than that in the entire statement, so that if they are omitted the statement would be favorable. The reason for his comparative decline in the largest two cities of the country is that the construction of buildings a year ago was very active. The supply of office room in the larger skyscrapers has been rather overdone and in that particular branch of construction work there will therefore be some moderation until demand for space more nearly equals the supply. It may be added that the cost of the skyscraper, as compared with that for the great majority of structures, is so great that a difference of one building turns the comparison sharply one way or the

It is gratifying to note the general improvement throughout the country." Many cities made heavy gains over a year ago. Among these may be mentioned, with their percentages of gain, the following: Baltimore, 182: Cedar Rapids, 169; Duluth, 246; Grand Rapids, 318; Peoria, 274; Pittsburgh, 204; Seattle, 115; Shreveport, 141; Topeka, 179; Worcester, 233. Of the 54 cities, 30 show gains. The figures in detail are as follows:

January

JAMES & ABBOT COMPANY Lumber and Timber No. 165 Milk St., BOSTON, MASS.

VENEERS

Your profits depend largely on economical production, and uniformly cut veneers lessen the cost of production.

Our employes are experienced, our machinery modern, and we use the best selected logs in Mahogany, Circassian Walnut and Quartered Oak.

Therefore, we will furnish you with absolutely uniform and bone dry sliced or sawed veneers that your men can handle with a minimum outlay of time and labor.

This Means Money in Your Pocket

We will welcome you to our plant (which is so modern it's worth coming to see) or we will send a representative with samples, on request.

Fred W. Black Lumber Co.
2245 S. Crawford Ave. Chicago, Ill.

J. C. Knox of Cadillac, Mich., secretary of the Michigan Hardwood Manufacturers' Association, attended the meeting of the board of governors of the National Lumber Manufacturers' Association held in Chicago recently.

J. T. Phillips, general manager of the Diamond Lumber Company of Green Bay, Wis, was in the city for a few days of last week. E. Bartholomey of John B. Ransom & Co. Nashville, Tenn. spent a

E. Bartholomew of John B. Ransom & Co., Nashville, Tenn., spent a few days in Chicago recently on business.

John D. Mershon of the John D. Mershon Lumber Company of Saginaw, Mich., spent a few days recently with the local trade.

The bulletin dated February's Issued by the Hardwood Manufacturers' Association of the United States is quite an unusual publication of the kind. The design on the front page is particularly striking, being supposed to illustrate graphically the Hardwood Manufacturers' Association as between the producer and the consumer of hardwoods. The association is represented as the keystone in the arch formed by the producers on the one side and the consumers on the other. The whole bulletin is very well gotten up and really deserves close attention.

M. L. Pease of the Galloway-Pease Company of Poplar Bluff, Mo., spent a few days last week with the Chicago trade.

F. J. Roys of the Fullerton-Powell Hardwood Lumber Company of South Bend, Ind., was in Chicago on Friday and Saturday of last week.

=< NEW YORK >=

The new mill plant of the Santa Clara Lumber Company, 2 Rector street, is fast nearing the point where actual production will be under way. The reorganizing of the company's manufactory will put the entire plant in practically one big operation. The new branch was formerly owned by the Norwood Manufacturing Company at Tupper Lake. Hardwood flooring and finish will be manufactured in addition to soft woods.

John W. Love, who with Hamilton Love are the only partners in Love, Boyd & Co., as a result of the withdrawal of J. W. Boyd, will continue headquarters in this city. He says the business will be continued as heretofore, excepting perhaps they may do less manufacturing.

The Morgan Millwork Company has moved its local headquarters to 6 East Thirty-ninth street, the Craftsmen's building. Five floors of the building are taken up by an exhibition of building materials and the Morgan company is showing some fine samples of its product, which includes doors, moulding and interior finish.

F. J. Cronin, representing the Meadow River Lumber Company, Rainelle, W. Va., was a New York visitor during the fortnight. He reports an improved inquiry for hardwood lumber and flooring and looks for a good year.

Fire on January 30 caused heavy damage to the plant and building of the Walker Piano Company at East Sixty-third street.

A big crowd and a good time are assured at the forthcoming dinner of the local trade. The date is February 19, at the New Biltmore, near Grand Central Terminal.

---<- BOSTON ≻=

The hardwood situation in this market at the opening of the present month seems to be one of anticipation rather than any marked change in the volume moving. Many of the large dealers seem to have an underlying confidence in the current year. The dullness which has become commonplace at this season is still with us, but its influence on prices is noticed only in certain items. There is no question that the hardwood market here is affected, especially in woods heretofore used more or less in finish, by the uncertainty of what is to be done in Pacific coast finish lumber via the canal. Items in the local press and trade news indicate that there are possibilities of supplies of suitable lumber in large quantities and low prices, to take the place of some of the hardwoods. Perhaps the weakening of poplar and gum might be attributed in part to these prospects. A slight falling off in plain oak is probably caused by pressure of some of the smaller mills who can make this stock to move some of it as it might be said that the weakening has not been so noted in the extra manufactured or what may be called 'big mill" stock. Along the same line quartered oak is stronger than it has been. The call for this wood comes in all thicknesses instead of a few, especially in those under 1 inch. Quartered oak strips and flooring seem in poor supply here, and there is call for them. Ash in general is strong, with brown ash still leading the southern. While there is not much beech used here the value is emphatically increasing, while maple and birch do not seem to have any noticeable changes. Sycamore is another wood which does not move in large volume, but has had for some time a constant tendency to high prices here. There is standing inquiry for walnut, but prices are hard to compare in general; if it is wanted very much, any price may be quoted on the higher grades, while the common and lower grades are about as they have been. Cherry is scarce in low grades, while common and upper grades are in good supply at about the recently prevailing prices.

The annual meeting of the Massachusetts Wholesale Lumber Dealers' Association was held in Boston January 21 at Young's Hotel. The officers ciected were William E. Litchbield president, Charles S. Wentworth, vice-president. E. C. Hammond, secretary and treasurer. Geo. H. Ellis of the Massachusetts legislative committee on railroads delivered an address, which in general received the accord of the meeting that action relating to our railroads should be constructive and carefully considered if we want to avoid a serious situation. This association voted to appoint a committee to draw up and submit the necessary charter and

other papers to incorporate the body. This will be an important step in its long and useful history

The reports are that the creditors of the Brett Lumber Company of Lynn, which recently assigned, will receive substantial dividends if the prospects of favorable adjustments of the estate materialize.

William E. Litchheld of Boston has non again selected to represent the Boston Chamber of Commerce at the convention of the National Chamber of Commerce in Washington this month. The field secretary of the latter organization, Harry F. Atwood of Chicago, addressed the Boston Chamber on February 5 and denounced the excessive legislation proposed in Massachusetts this year. It is noted, however, that there is much less aimed at the discouragement in this state of wooden building than there was last year.

It is reported that the well-known firm of Lawrence & Wiggin of Boston is to furnish the docking facilities for the new Boston & Pacific Steamship Line. It is understood that complete plans will soon be given out.

=**≺** BUFFALO **>**=

The Lumber Exchange committee of entertainment, which will look after the convention of the National Wholesale Lumber Dealers' Association on March 4 and 5, will probably arrange the details for the hardwood convention in June also, although it has not been decided definitely. The opinion of some of the leading hardwood men is to the effect that this committee, of which M. M. Wall is chairman, is likely to serve for both conventions. President A. W. Kreinheder of the Lumber Exchange will also have general charge of the arrangements.

The hardwood business established by O. E. Yeager a dozen years or so ago has been incorporated and Mr. Yeager's three brothers are now connected with the company as officers. The capital of the concern, which will be known as the Yeager Lumber Company, is \$200,000, and the yard, which has recently been increased by the purchase of the Stewart yard, will be one of the largest in the city. Officers of the company are as fol-Orson E. Yeager, president; Frank G. Yeager, vice-president; Charles A. Yeager, secretary; Peter N. Yeager, treasurer.

George W. Appleby, a Jamestown lumber dealer, has bought the plant of the Ideal Furniture Company in that city, and it is said that a new company may be formed to operate it.

W. K. Jackson of Jackson & Tindle left here late last month for the firm's hardwood operations in Michigan to be gone about ten days. Stocks at the mills have been well sold up.

Nelson S. Taylor of Taylor & Crate, has been in the Adirondacks lately. Mrs. Taylor accompanied him.

W. W. Reilley left here on January 29 for San Francisco, where he takes passage on February 12, with Dr. and Mrs. Charles VanBergen, for a three months' trip to China, Japan and other countries.

R. D. McLean sailed last month for a vacation trip to Cuba, and Hugh McLean left immediately after the Memphis convention for a trip to the

I. N. Stewart has given up his Elk street office and is now looking after the building trade, having taken an up-town office with the general insurance firm of John A. Murphy & Co.

A. J. Elias was in Albany last month as a member of a delegation from this city which appeared before a legislative committee in the interest of commission government.

Anthony Miller states that the hardwood trade does not show much Improvement this month, although there is about a normal business doing

Davenport & Ridley have been getting in fair stocks of hardwoods from Pennsylvania, chiefly oak and maple, and say that hardwood trade is fair

F. M. Sullivan has been making a business trip to Michigan In the Interest of T. Sullivan & Co. The yard reports increased demand in a number of different bardwoods.

C. C. Slaght is still spending a great part of his time at his mill at Genesee, Pa., where his new summer log-house is nearing completion, with all modern improvements.

=≺ PHILADELPHIA **>**=

Wilson H. Lear, who carries between sixteen and seventeen million feet of lumber at his two yards at Front and Palmer streets, and Girard avenue and Fetzer street, and another stock of some eight million feet at his mill, has no fault to find with conditions. He handles lumber of every description, and no one is ever turned away for lack of the desired wood. He is a thorough optimist and anticipates an early advance in trading all along the line.

Frank R. Whiting, president of the Whiting Lumber Company, says the wholesale shipments are still a little slow, but yard business has livened up considerably during the last fortnight.

W. R. Taylor of the W. R. Taylor Lumber Company reports incoming

business right along, but constant hustling is required. He is much interested in gum just now; recognizes it as a comer, and so is pushing It along.

Edwin A. Gaskill, son of Nathan B. Gaskill, this city, has associated himself with the Turkey Foot Lumber Company, Heidelberg, Ky. He will have charge of the mill and woods department.

It is reported that J. E. and Edwin Moore, Danville, Pa., have purchased 12,000 acres of timberland in Bath county, Virginia, from R. S. Turk,

Fire visited the furniture factory of George W. Smith & Co., Inc., on January 21. The damage is estimated at about \$10,000.

The Southern Timber and Power Company, Wilmington, Del., was chartered under Delaware laws January 27, with a capital stock of \$100,000

The annual meeting of the Sawdust Club of the Union League, which is entirely apart from the elaborate and exclusive function held always in December, and to which hitherton on publicity has been given, was held on January 23. It is simply a good fellowship and social dinner at which all business is eliminated. Frank C. Gillingham, who has been the president of the club from its beginning, is always re-elected. George Warner was elected secretary and treasurer.

=≺ PITTSBURGH >=

Gifford Pinchot, formerly head of the Forestry Bureau of the United States, has been chosen as candidate for United States senator from Pennsylvania on the Washington party ticket.

E. B. Hamilton of the Hamilton Lumber Company recently made quite an extended trip through northern Pennsylvania and western New York, and found things pretty dull.

The Foster Lumber Company is getting some nice contracts for 1914 and is selling all the lumber it can cut at its country mills. Most of this is oak and hardwoods for railroads.

J. J. Linehan, known to all lumbermen in Tri-State territory as an experienced hardwood man, has given up his office at \$16 Fulton building and will in the future have his headquarters at Cleveland, where he will handle the stocks of the Mowbray & Robinson Company of Kentucky.

The National Casket Company of this city has let the contract for an additional 80×100 feet to its plant at Asheville, N. C.

The Kendall Lumber Company had a mighty good month in January and is well satisfied with the outlook for business this year.

The Aberdeen Lumber Company has been bringing up some big barges of gum and cottonwood, and President J. N. Woollett is trying hard to get his full share of business in this line.

The Henderson Lumber Company of late has been very fortunate in getting some good orders for hardwood contracts which will keep it busy much of the year. Most of these were in other cities.

The Allegheny Lumber Company reports a fine start for the year and says that prices are getting stiffer.

H. F. Domhoff, president of the Acorn Lumber Company, has added two more salesmen to his force. H. W. Henninger of this company has been in West Virginia recently buying some hardwood stock.

The J. W. Cottrell Lumber Company is putting in a new mill at Kingwood, W. Va., on the Morgantown & Kingwood railroad, where it will cut oak and mixed hardwoods for railroad and mine properties.

The Duquesne Lumber Company had a fine month in January and is well satisfied with general business.

==< BALTIMORE ≻=

At the annual meeting of the stockholders of the Maryland Lumber Company, held at the Hagerstown Court House on January 20, the following officers and directors were elected: President and general manager, John A Denison; vice-president and attorney, Abraham C. Strite; secretary and treasurer, Samuel W. Sowers; directors, John A. Denison, Samuel W. Sowers, E. M. Huyett, W. H. Wyand, Ira K. Gruver, H. W. Shafer, Samuel S. Stouffer, Daniel A. Stickell, John G. Ernst and A. C. Strite. The company operates a mill at Denmar, W. Va., where it owns some 17,500 acres of timberland and a standard gauge railroad. The output last year was reported to be 124,514,556 feet of lumber, mostly hardwoods.

The new mill of the R. E. Wood Lumber Company of Baltimore, at Earhart, about seven miles below Bristol, Tenn., was put in operation about ten days ago and has now begun to run with considerable regularity. It is a six-inch band and will have enough stumpage to work on for several years. The company owns some 2,500 acres of timber which was acquired last summer. President R. E. Wood and General Manager G. L. Wood of the company have just made a visit of inspection to the plant, and have also gone to other operations, among them those in West Virginia and on Eagle Creek, Swain county, N. C.

According to information received from Winchester, Va., surveys have just been completed and the route established for a standard guage railroad 100 miles long, through Grant and Pendleton countles, West Virginia and parts of Highland and Bath counties, Virginia. The railroad is to run from Petersburg, the southern terminus of the Hampshire Southern railroad, to the Hot Springs branch of the Chesapeake & Ohio, and it will be known as the Petersburg & Columbia Springs Railway. The stockholders are John Y. Hite, president of the Potomac Lumber Company and the Forest Lumber Company; A. R. Watson, John Marcus Hite, Lloyd Bailey and R. L. Long of Fairmont, W. Va. The new road is designed chiefly to afford an outlet for the lumber from the sawmills of the two corporations mentioned. These plants have about 26,500 acres of timberland to draw upon and are turning out millions of feet a year, mostly hardwoods, which are accounted among the best in the section. The Potomac Lumber Company has a large mill in operation at McNeill, Hardy county, Va., but at present all of its output must be hauled to

the railread by wagon, which is undo vexpensive. There is a great abundance of white eak on the trace

The Morgan Willwork Company, of which to H. Hanseom is president, has obtained a permit to creef a build in, of two stores and to cost about \$75,000, on a lot 124 by 160 feet, at 113 West North agenue. The structure will be used for warehouse purposes and is conveniently located to four lines of radio ad

Wm. D. Gill & Son have secured (1) contract to supply the city engineer's department with all the lumber and creessted blocks needed this year for repairs to roads, bridges, sewers and streets.

The receipts here of mahogany from South Africa appear to be on the increase. The steamship Quernmore, of the Johnston Line, on her arrival January 26 from Liverpool brought not less than 419 logs of this wood. Most of the shipment was consigned to western points

Representatives of two of the largest mahegany firms in the country visited Baltimore last week, they being Rhoderick 8. Huddleston of the Otis Manufacturing Company of New Orleans, and Julius Spicker of the C. C. Mengel & Bro. Company, Louisville. Both arrived here almost at the same time, being on an eastern business trip. The two concerns, which are among the largest in the country, handle mahogany from Africa, Central America, Mexico and other countries, and always keep in stock large quantities of logs of every kind.

Another shipment of West Virginia spruce was taken out on the Norweglan bark Angerona, which cleared for Roasario, Argentina, South America, on January 23. The McCall-Dinning Company, ship brokers, attended to the Custom House details.

Herr Eugen Glaeser, who stated that he was representing J. F. Müller & Soln of Hamburg, the lumber and log importers, called on some of the exporters here last week and incidentally let it be known that he intended to open an office in the United States for the firm and take charge, buying both lumber and logs, and shipping them to the German port. In other words, he was to act as the permanent representative of the firm in the United States, indicating that he thought his employers could thus get a better inspection and lower prices than it has been possible to obtain through the established exporters. He thought of locating either in Memphis or in Cincinnati, with his preference for the former city. If so, he would be in the market for oak, ash, hickory, walnut, poplar, gum, yellow pine and practically all other commercial woods. Mr. Glaeser is about thirty years of age, and has been in this country before, making occasional trips to study trade conditions.

President Fred Arn, of the National Lumber Exporters' Association, has appointed M. S. Baer of Richard P. Baer & Co.; H. E. Schadt, Hyde Lumber Company, South Bend, Ind., and W. J. Eckman of the M. B. Farrin Lumber Company, Cincinnati, to represent the National Lumber Exporters' Association at the annual meeting of the National Wholesale Lumber Dealers' Association, which meets this year in Buffalo.

The Amherst Lumber Company of Amherst, O., has been incorporated with a capital of \$30,000, to deal in lumber, by William H. Schibley, C. W. Menz, A. Baker, A. E. Jenne and L. P. Lersch.

The H. D. Brasher Lumber Company of Columbus has been incorporated with a capital of \$60,000, to de a general wholesale lumber business. The incorporators are L. A. Brasher, E. G. Dillow, H. B. Walker, A. J. Hatch and G. D. Armstrong. The company was formerly a partnership with offices in the Columbus Savings & Trust building. Offices have been moved to the second floor of the building at Fourth and Gay streets.

The Western Lumber Company of Columbus has been incorporated with a capital of \$50,000, to do a general lumber business, by M. C. Sisson, W. B. Sisson, S. E. Robinson, B. E. Tanner and H. M. Robinson. The company will have offices in the Wyandot building, and retail yards at London and Mechanicsburg. W. B. Sisson, formerly sales manager of the Sowers-Leach Lumber Company, is president; B. E. Tanner, vice-president, and H. M. Robinson, secretary.

The Kendall Lumber Company of Pittsburgh has opened a branch office in Columbus,

L. Taylor & Son of Rarden, O., have purchased timber on the Mansfield tract near Sciotoville, and will move their sawmill to that place.

According to the statement of the Columbus building inspector for the month of January, there were 122 permits having a valuation of \$178,740, as compared with 105 permits and a valuation of \$208,335 in January, 1913.

Much of the opposition to the Ohio workingmen's compensation law, which became effective January I of this year, is passing away and many of its enemies are becoming its supporters; but, on the other hand, there are a number of changes necessary before the law is a good one for all Durposes.

W. H. Dawkins, W. E. Berger, L. N. Davis, Harry Ward, D. G. Dawkins, A. W. Booth, E. B. Berger and A. W. Abele were elected directors of the Dawkins Lumber Company of Ironton, O., at the annual meeting held recently.

John R. Gobey of the concern bearing his name says there is a slight improvement in the hardwood trade in central Ohio territory and the outlook for the future is much brighter. Prices are being well maintained.

F. Everson Powell of the Powell Lumber Company says the hardwood trade is holding up well despite the business depression. The volume of business is gradually increasing.

Managet Hodil of the Virginia Lumber Company says the hardwood demend is being well maintained in central Ohio territory, with prices anothing stands

Secretary Benbow of the Sowers-Leach Lumber Company says there is a quit market in hardwoods, although prices are not weakening to any extent.

F. B. Pryor of the W. M. Ritter Lumber Company says the volume of business in all lines of hardwoods is holding up well and the outlook for the inture is bright. There is a good volume of business from yardmen and also from factories. Furniture concerns are expected to buy better in the near future.

The Bucyrus Lumber Company of Bucyrus, O., has taken over the Voll-rath mill at that place and will start operations in the near future.

The P. L. Frank Lumber Company of Ravenna, O., has been incorporated with a capital stock of \$50,000, to do a general lumber business. The incorporators are P. L. Frank, L. J. Frank, E. G. Frank, L. L. Boedwin and S. J. Frank.

The sawmill at West Manchester, O., owned by W. R. Already, was almost totally destroyed by fire recently, causing a loss to exceed \$6,000. The mill was not protected by insurance.

The Toledo Screen Company of Toledo has filed papers with the secretary of state changing its name to the Toledo Lumber and Millwork Company.

The Consolidated Tie and Lumber Company of Marietta has been incorporated with a capital stock of \$10,000, to carry on a general lumber business. The incorporators are G. H. Crawford, C. C. Middleswart, D. C. Sayage, C. E. Steener and J. A. Zimm,

The Springfield Planing Mill and Lumber Company of Springfield hasfiled papers with the secretary of state increasing its capital stock from \$20,000 to \$66,000.

The Gleaville Lumber Company of Cleveland has filed papers with the secretary of state increasing its capital stock from \$25,000 to \$50,000.

=< CINCINNATI >=

The Appalachia Lumber Company, formerly of Columbus, has established a yard in the St. Bernard district now so popular with lumbermen for yarding. It will have about two acres and will not yard stock at Appalachia, Va., any longer than necessary, shipping stock as soon as in condition to the Cincinnati yard, which will be the distributing point. This makes to date about ten companies who have recently recognized in Cincinnati both market conditions and distributing facilities second to none in the country and moved or established big branches here within the last year. Secretary-Treasurer Cortelyou recently said: "We had our offices at Columbus, but found it best to move into this market. There are more visitors seeking hardwoods in Cincinnati than elsewhere and naturally it will be easier to distribute lumber from this section. Then, too, there will be a shorter haul, which will make a considerable saving."

The officers of the Lumbermen's Club are to be congratulated over the success of the convention of the Ohio Retail Lumber Dealers' Association which opened up here last Tuesday and closed Thursday. The meeting was a success in every way and the usual hospitality of the club was not lacking. The visitors were royally entertained and were pleased at the very large attendance, more than six hundred having registered.

=< TOLEDO >=

The Toledo hardwood field has an unique record in having, perhaps, one of the very few women managers of a hardwood business. Miss Elizabeth Keasey has filled the office of manager of the Keasey Pulley Company for the past several weeks and she has found the work so much to her liking that she will continue in her chosen field. The death of thelate Theron D. Keasey, president of the company and father of Miss Keasey, brought her to the acceptance of this office. The Keasey Pulley Company is one of Toledo's oldest and best-known lumber concerns. With the death of Mr. Keasey in early January the trade lost one of its ablest and most respected members. He was a tireless worker, and when the Keasey Pulley Company finally did abandon business after twenty-five years of industry, he worked until he had effected a complete re-organization. Then work at the plant was renewed. Thiswas in March of last year. Up to date the company has been successful in renewing the old contracts and has gone after the new business with a determination that has opened the way for an abundance of new business. The plant employes nearly twenty men. The death of Mr. Keasey followed a three weeks illness. He was buried at his old home town, South Bend, Ind. He was sixty-seven years old. Miss Keasey had been associated with her father in the office for some time and knows the business.

The Skinner Bending Company's business is now in the charge of theseofficers, who were recently elected: C. V. Skinner, president; J. S. Dugan, vice-president; F. B. Anderson, secretary and treasurer.

The Gotshall Manufacturing Company reports an excellent business in February, considering conditions.

=< INDIANAPOLIS >====

The Greenfield Woodturning Company has moved its offices from Greenfield to Columbus.

Wooden handles for hand tools will be manufactured by the Bloomfield Wood Working Company, organized and incorporated at Bloomfield by F. O. Hallock, E. A. Hicks and W. H. Woodell, with \$6,000 capital.

The Wisconsin Coal and Lumber Company of East Chicago has filed notice with the Indiana secretary of state of an increase in capitalization from \$25,000 to \$100,000

William H. McHenry, a retired lumberman of Aurora, died at his home in that city a few days ago from paralysis. He was seventy nine years old and is survived by a widow and two sons

William F. Stillwell, who was president and manager of the Henry Taylor Lumber Company, Lafayette, until that company went into the hands of a receiver, died at a sanitarium in this city recently. He had been a patient in the sanitarium two years. A daughter survives.

George Seeger, Sr., sixty-six years old and one of the oldest lumber dealers in Lafayette, died of heart failure at his home in that city a few days ago while talking with members of his family. He was formerly a member of the Lafayette city council.

Building operations are increasing in the city, which is regarded as an indication of improved business conditions. In January building permits issued amounted to \$450,000 as compared with \$305,385 for the corresponding month of last year.

With the purpose in view of maintaining the open shop in dealing with labor questions, the Associated Employers of Indianapolis has been formed. With the new organization are merged the Employers' Association of Indianapolis and the Commercial Vehicle Employers' Association. Many lumbermen belong to the new association.

-----≺ MEMPHIS **>**--

James F. Stark, president of James E. Stark & Co. and vice president of the Memphis Vencer & Lumber Company, will represent the lumber interests of Memphis and the Memphis territory at the hearing to be conducted at New Orleans February 12 in connection with the proposed establishment of a regional bank at this point. All the commercial organizations of this city, together with the various lines of activity, including the banks, will be represented by a large delegation, and everything possible will be done to secure one of these institutions for Memphis. Lumbermen's Club of Memphis some time ago adopted resolutions strongly favoring Memphis and the lumbermen have been prominent in the movement looking to the designation of Memphis as the home of one of the institutions. Efforts to secure a hearing at Memphis failed and then it was decided that a delegation should be sent to the Crescent City on the date indicated.

The Southern Hardwood Traffic Bureau has again been successful in a petition filed before the Interstate Commerce Commission. The latter has just handed down a decree in the case of this body against the Illinois Central and Yazoo & Mississippi Valley roads, whereby a rate of ten cents is ordered on shipments of logs from points south of the main line of the Southern Railway in Mississippi to New Orleans, as against the old rate of eleven cents. By virtue of this decree, the rate from points north of the main line of the same road is reduced from twelve to eleven cents. It is estimated that lumber firms here will effect an annual saving of about \$5,000 by the terms of this decision. The petition was filed in the interest of R. J. Darnell, Inc., Russe & Burgess, Inc., the Bellgrade Lumber Company, A. N. Thompson & Co., and other firms here having extensive timperland holdings in Mississippi.

Prospects are bright for the establishment of one or more hardwood mills in Clarke county, Arkansas, by McDonald Brothers for the development of the timber on 10.742 acres which they have just purchased from S. Thornton and others in that territory. The consideration was \$150,000. The transaction was consummated through the real estate department of the Union & Planters' Bank of this city. There is a large quantity of cypress, oak and gum on the property and it is announced that immediate steps will be taken for the development thereof. The purchasers reside at Pine Bluff, Ark.

J. K. Ingram, a prominent millman of Byhalia, Miss., who was recently shot from ambush by a negro and who has been in the Baptist Memorial Hospital here for more than a week, is rapidly recovering. It was thought that he had but little if any chance to recover, but he has safely passed the crisis and is gaining in strength every day. The negro who shot him has been arrested through the unusual efforts of about 250 men in the section tributary to Bybalia.

The Chamber of Commerce of Pine Bluff, Ark., has raised a bonus of \$2,000 with which to purchase a site for a large veneer firm in Indiana, and it is announced that the latter will erect a plant at that point, involving an outlay of approximately \$50,000.

The Arkansas Land & Lumber Company, Malvern, Ark., has begun operating its new mill at that point. Gilbert L. Mettison is in charge of the plant and A. Lanott is sales manager.

J. W. McClure of the Beligrade Lumber Company has been re-appointed head of the supervisory board of mendicancy by Mayor Crump. He filled the position so successfully last year that it was desired that he should continue to look after that important municipal problem.

The new plant of the Usher Lumber & Manufacturing Company at Meridian, Miss., has been completed and placed in operation. It represents an outlay of about \$25,000 and will be used in conducting a milling-in-transit business, catering particularly to the wholesale trade.

J. T. Willingham, president of the Memphis Coffin Company, will head the delegation that will go from Memphis to Nashville to attend the annual of the Tennessee Manufacturers' Association to be held there in April. He is president of this body. The exact date of the meeting will be an-

Walnut for Export

Thirty years' experience in the handling of walnut logs for export enables me to furnish guaranteed prime quality stock.

I am constantly in close personal touch with the source of supply of export walnut logs and know exactly what I am getting at all times. In fact, a number of the best foreign houses are taking up my logs on my own recommendation.

My supply enables me to fill orders of any size in carload lots without delay.

Highly Figured Walnut

As a result of close personal supervision of log purchases my stock of highly figured wal-nut in long wood and stumps contains only the choicest in figure and curl that can be found.

All this stock is carefully selected to take care of a discriminating demand.

My figured stumps are all dressed closely and when shipped are practically in shape for

Youwill lose nothing by trying me on your next inquiry.

nounced rate: The decision to hold the next meeting at Nashville has used been reached by the overid of governors. This association is fluishing only its second voa-but it has a very large membership. Lumbermen of Memphis are prominently identified therewith.

The L. D. Murell's Lamber Company has opened offices in the Randolph building here and will engage in the wholesale handling of hardwood ounder. It is also making arrangements to take the output of some of the unils in this section. Mr. Murrelle, the principal owner, was until recently vice-president of the Dudley Lumber Company and before that he was a dentined with Stoche & Hobbard of St. Louis.

The Dudley Lumber Company has decided that it will open offices and yards in New Orleans to be used in handling its export business. These will be in charge of J. W. Wallace, who has been in the employ of the

Dudley Lumber Company for a long while.
The Porked Leaf Oak Company has completed the installation of its machinery at Heber Springs, Ark., for the manufacture of wagons and wagon stock.

Mathews & Glistrap of St. Paul, Ark., are installing a sawmill on the tract of 3,000 acres recently purchased in Franklin county. This irm has been engaged in the manufacture of cooperage stock but will discontinue this phase of its business. Machinery for the manufacture of chair stock will be operated in connection with the new mill.

The DeSha Land and Timber Company, with headquarters at Arkansas City, has been granted a charter under the laws of Arkansas. The capital stock is placed at \$200,000. Organization has been perfected by the election of the following: F. M. Lewis, president; Wallace Townshend, vice-president, and J. L. Parker, treasurer. But a small percentage of the capital stock has been subscribed.

The Detroit-Arkansas Logging Company, which purposes to conduct a general lumber business, has also been granted a charter. Headquarters are to be maintained at Arkansas City. The capital stock is \$100,000. B. J. Terry is president and treasurer and Jack Bernhardt is vice-president and secretary.

The Chess & Wymond Company, prominently identified with the manufacture and distribution of cooperage stock, has filed articles of incorporation under the laws of Arkansas. It is a Tennessee corporation and sets forth that it has \$236.101.65 in assets. Savage Mabry, with head-quarters at Mountain Home, has been officially designated as agent for service.

J. S. Kimbro has recently completed and placed in operation a new saw-mill at Monticelio, Ark., and that town boasts another new enterprise in the form of a big factory which is being creeted by the Sigman Stave Company. The latter will give employment to between 200 and 300 persons.

=≺ NASHVILLE **>**=

According to statistics collected by the Nashville Lumbermen's Club, the hardwood business of this city holds up well to the mark of past years. The committee of business men working to secure one of the regional reserve banks for Nashville under the new currency law has been gathering general data as to the financial and commercial affairs of Nashville, and requested the Lumbermen's Club to furnish an estimate of the volume of hardwood lumber business handled annually. The statistics committee of the club reported estimating the annual business at \$10,000,000, divided as follows: Pennsylvania, twenty per cent; New York, thirty per cent; New England, twenty per cent; Illinois, ten per cent; west and south, twenty per cent.

Charles M. Morford, president of the Nashville Lumbermen's Club, Capt. Wm. Farris and T. A. Washington have been named delegates to represent the club at the meeting of the National Wholesale Lumber Dealers' Association at Buffalo, March 4-5.

Liberal shipments of cedar posts have been arriving from points on the upper Cumberland river, being moved by water. Capt. Geo. Doubleday, a local steamboat man, said the supply of cedar in the upper Cumberland river is surprising. Middle Tennessee has been famous in the production of red cedar, and it has been feared that operations would clean up the supply. Reports that have been received from important cedar sections show that there is a second growth of cedar in some fifteen or twenty years that is very gratifying.

The Nashville Board of Trade and Commercial Club, leading business organizations, will soon be consolidated. The plans for consolidation are being perfected. Up to last week 1,900 members had been enrolled for the consolidation, and it is expected that several hundred more members will be secured. The final plans are to bring all of the commercial organizations in the city into affiliation. The Nashville Lumbermen's Club has voted in favor of affiliation. It is believed that ultimately all of the commercial bodies will have erected a modern skyscraper in the central part of the city, and get under one roof.

The Tellico River Lumber Company announces plans to have rebuilt its big plant at Tellico, Tenn. The plant was destroyed by fire some time ago, causing a loss of about \$150,000. The new plant of the company will have a daily capacity of 150,000 feet of lumber. The company is one of the biggest lumber concerns in east Tennessee.

The Walden Lumber Company of Memphis, with authorized capital stock of \$50,000, has been granted charter by the secretary of state. James E. Walden, Charles R. Miller, William J. Meyer, Henry C. Davis and M. C. Helchum are incorporators.

Secretary Γ B. Fowler of the Indiana I innormal's Mutual Insurance Company says the report that his cost Γ (γ) contemplates is axing Tennessee By erronous. The company has (2, 2, 3, 4, 4, 6, 8)

The Traffic Bureau of Nashville has elected the following officers for this year: Charles S. Martin, president; W. L. Davis, vice-president; Walter H. Clarke, secretary; John Conde, treasurer; T. M. Henderson, commissioner. The bureau has hard a special decord the past year in safeguarding the interests of shippers of Nashville.

W. A. Machem et the Wood Meson Coop and New Albany, Ind. was a visitor to the local market and placed several orders for hardwoods for his company. Mr. Machean was very optimistic In his views of the

future possibilities of hardwoods.

==≺ BRISTOL >=

A deal was closed here last week whereas the Doughs & Walkley Company of Elk Valley, Tenn., acquires all of the timber holdings of the Virginia Iron, Coal and Coke Company, near Tacoma, Wise county, Va. Lee McChesney of Bristol, who has been in charge of the Elk Valley (Tenn.) operations of the company, will have charge of the new operations to be installed near Tacoma. The new tract consists of approximately 20,000,000 feet of virgin hardwood stumpage. A band mill will be installed at once.

The Mowboa's A Rodenson Company of Communate has purchased an area of 40,000 acres of timberland in Clay and Leslie counties, Kentucky. The company has leased a water front at Ouelda, Ky, and will put in booms there, catching the logs that float down the three focks of the south fork of the Kentucky river and raftire them to the big mill at Heidelberg, Ky,

Most of the mills in this section are busy. Weather conditions during the past few weeks have been almost ideal for this season of the year, and as a result there is unusual activity in manufacturing.

There are numerous eastern buyers on the local market. They have left some nice orders within the past few days. They report the business outlook as much improved.

The Peter-McCain Lumber Company's wills here are running full time. The company has a large amount of steek on hand and has a big timber sumply from which to draw.

G. L. Wood, general manager of the R. E. Wood Lumber Company of Baltimore, was here last week from Asheville, N. C. He visited his company's new plant at Earhart's, a few miles south of Bristol, where a logging road has been built and a large band mill installed.

E. L. Warren is now associated with J. A. Wilkinson, agent. Mr. Wilkinson has several men on the road and is moving a large amount of

bardwood lumber, chiefly for export.

The installation of a new mill will be begun at once by J. E. Wilkinson of Dublin, Va., near Kingsport, Tenn., where he has purchased a good sized area of hardwood timber, located in the Chestnut Ridge section of Sullivan county. The lumber will be shipped out over the Carolina, Clinchfield & Ohio railroad.

W. R. Howard of Hopkinsville, Ky., is preparing to install a new mill near Harriman, Tenn., where he has purchased a tract of timber.

H. G. Guyan has returned to his home at Humbert, Pa., after spending some time in this section making arrangements for the installation of a large operation in southwest Virginia. Mr. Guyan has purchased a large area of timber and will install a band mill and construct a logging railroad.

-----≺ LOUISVILLE >=

The Churchill-Milton Lumber Company is the style of the latest accession to the hardwood lumber trade in Louisville. John Milton, vice-president of the Booker-Cecil Company, and T. Smith Milton, sales manager of the Louisville Point Lumber Company, are the members of the new company, which is capitalized at \$50,000. Offices are in the Lincoln building, and a yard will be established, probably in South Louisville. The company will deal extensively in native hardwoods, and in view of the popularity and ability of the members of the company, success seems to be assured.

The Stemmelen Lumber Company, which has been operating in the local hardwood trade for some time, has been incorporated with \$30,000 capital stock, E. F. Stemmelen and his brother, J. A. Stemmelen, being the active members of the company. Offices are in the Keller building. The company plans to establish a large wholesale yard in Louisville or vicinity, and will complete plans along this line in the near future.

Reports have been current in the local trade for some time that the C. C. Mengel & Bro. Company is planning the erection of a large reinforced concrete sawmill building, which will house all departments of the mahogany manufacturing company. Officials of the company state that while the plans are under consideration, no definite decision regarding the erection of the mill has yet been made. The company has found the demand for its Mexican and Honduras mahogany in Europe to be excellent, two shiploads of logs having left Belize recently. J. C. Wickliffe, secretary of the company, is at present abroad investigating trade conditions.

R. S. Huddleston, general manager of the Otis Manufacturing Company of New Orleans, was in Louisville recently, and said that he believes 1914 will be a corking good year. Mr. Huddleston has just completed a trip to leading markets, and has found sentiment, especially in the East, much more optimistic than usual at this time of the year.

Barry Norman, vice-president of the Norman Lumber Company, and for some time manager of the company's big mill at Holly Ridge, La., pleasantly

surprised his triends in Louisville by getting married without previous announcement. The bride was Miss Martha Anne Dowling of New Orleans, where the wedding took place January 29. Mr. and Mrs. A. E. Norman of Louisville, parents of the bridegroom, were among those present. They have started housekeeping at 8011 Hickory avenue in New Orleans. The hardwood men of Louisville have sent Mr. Norman their heartiest congranulations.

The Louisville Hardwood Club recently considered a resolution to endorse the request of the railways for a five per cent horizontal advance, but no action was taken on it other than reference to a committee. The reason for this was that the local hardwood men are now backing a complaint to the Interstate Commerce Commission against such an advance in Southern territory, and it was felt that a resolution of the kind indicated would be prejudicial to the interests of the petitioners.

Lumbermen have had to keep their eyes open wide to continue posted on the legislative situation at Frankfort, all kinds of bills affecting the industrial situation having been introduced. The workmen's compensation situation is complicated, the coal operators and the labor unions having joined forces, apparently, for the purpose of getting a state insurance feature into the bill which is finally passed, while the manufacturers at large, represented by the Kentucky Manufacturers' and Shippers' Association, are opposed to state insurance, and also have proposed a schedule of compensation which, while up to the average of those provided in other states, is not as high as the labor bill provides. It is almost certain that a compensation measure of some kind, affecting every lumberman in the state, will be put through before the end of the session next month. The Finn bill, providing for an extension of the powers of the railroad commission, seems doomed to defeat, many commercial organizations having gone on record as being opposed to it. The Glenn bill, which would give the state fire insurance board absolute power over rates, and would almost certainly drive the fire underwriters out of the state, is also opposed by the business interests generally.

The Louisville Veneer Mill is developing its lumber business rapidly. It is planning to enlarge its sawmill, and will carry a larger stock of lumber on its yard. Gus Smith is lumber buyer for the concern and H. E. Kline is superintendent of the mill. The company recently sold 50,000 feet of red gum to the City Mill & Lumber Company of Louisville for use on the Puritan apartment building, one of the largest structures of the kind put up in Louisville.

===≺ ST. LOUIS >=

At the meeting of the new directorate of the Lumbermen's Exchange, held several days after the annual election, the resignation of George McBlair, secretary for several years, was handed in and accepted. Walter D. Dodd was chosen to succeed him. Mr. Dodd was formerly connected with the Yellow Pine Manufacturers' Association and for a while was in charge of the Kansas City office of the association. He has also been assistant secretary of the Southern Cypress Manufacturers' Association under George Watson. More recently Mr. Dodd has been connected with the National Lumber Manufacturers' Credit Corporation.

The following committees to serve during the present year have been announced by President Smith: Traffic—Charles E. Thomas, chairman; H. A. Bockler and Jos. A. Hafner. Membership—Thos. E. Powe, chairman; Leo, C's Buder and F. C. Liebke. Public Affairs—W. R. Anderson, chairman; William Lothman, Jr.; E. H. Luehrmann and O. H. Sample. Fire Insurance—G. E. W. Luehrmann, chairman; Franz Waldstein and G. H. Cottrill. Re-inspection—Frank C. Moore, chairman; T. J. Noser and J. L. Bens.

During January, receipts of lumber by rail at St. Louis, as compiled by the Merchants' Exchange, were 14,480 cars. In January last year the receipts were 16,187, showing a loss in January this year of 1,637 cars. Shipments of lumber by rail last January were 10,339 cars. This January shipments were 10,377 cars, an increase of 38 cars this January, compared with the corresponding month last year.

A meeting of the officers and members of the standing committees of the St. Louis Lumbermen's Club was held at the Missouri Athletic Club carly in Junuary. Luncheon was served and plans were developed for great activities in the club during the present year. F. J. Riefling heads the membership committee. R. J. Fine is the chairman of the entertainment committee. The traffic committee has Thos. C. Whitmarsh, former president, for its chairman. W. E. Barns is the head of the publicity committee.

Secretary O. A. Pier of the Lumbermen's Club has sent out a circular letter to the various architects, engineers, contractors, etc., to give preference to lumber in building work. This letter also went to lumbermen's clubs, associations and lumber trade journals, urging the co-operation in the work started last October by the St. Louis club. Several responses have been received from clubs promising their co-operation.

rimore lying above and within two miles of, the Missouri & North, Vikansas railroad, between Edgemont, Clebourne county, and Pangburn, Wante canty. The National Cooperage and Wooden Ware Company recently established a large stave factory near Heber Springs, Ark., and with annual ture all of the sultable timber from the above tract into minsted staves.

The Clark & Gas Manufacturing Company of Little Rock has recently decreased its capital stock from \$80,000 to \$40,000. A certificate to this capital was filed in the office of the secretary of state of Arkansas on January 27. This company is engaged in the stave manufacturing business,

The Sandburg Interior Finish Company of Little Rock, on January 20, filed articles of Incorporation in the office of the secretary of state, showing a capital stock of \$15,000. Algot Sandburg is named as president, they Williams as vice president, and R. T. Bryson as secretary-treasurer.

A certificate of withdrawal from the state was filed in the office of the secretary of state by the Ferguson-Wheeler Land, Lumber & Handle Company of Poplar Bluff, Mo.

A new \$50,000 vencer plant will soon be erected at Pine Bluff, the owners being Indiana capitalists who have recently bought all of the gum timber owned by J. F. McIntyre & Son, hardwood manufacturers of Pine Bluff. This new enterprise will come to Pine Bluff as the result of negotiations through the Pine Bluff Chamber of Commerce, which has agreed to give a cash bonus of \$2,000 to be used toward purchasing a site for the new plant.

The Arkansas Handle Company of Little Rock filed articles of incorporation with the secretary of state of Arkansas on February 3. The enthorized capital stock is given at \$10,000. The incorporators are: A.*G. Wheeler, E. R. Morton, J. E. Griffin, E. E. Reedy and W. D. Brouse.

The Stigman Stave Company is rushing to completion a mill at Monticello. The plant when finished will employ some 300 men. The sawmill recently built by J. S. Kimbro on the Ashley, Drew & Northern Railway, near the Stigman company's plant, is now running on full time.

The Chicago Veneer Company of Danville, Ky., recently purchased the property of the old McKinnies Lumber Company at Clarendon, Ark., and will immediately begin the construction of a \$75,000 plant at that place.

The recent decision of the United States Supreme Court in the case of Chapman & Dewey Lumber Company vs. the St. Francis levee board, to the effect that the lumber company had no title to some 15,000 acres of land in Poinsett and Craighead counties, Arkansas, is regarded as of much importance because of its bearing on the question of title to about 125,000 acres of land similarly situated in eastern Arkansas, on the greater portion of which are standing large forests.

Arguments were heard hast week by Judge Jacob Trieber of the United States District Court at Little Rock in the case of the United States vs. Lee Wilson & Co., which is one of the many suits recently instituted by the government to quit title in itself to the so-called "sunk lands" in enstern Arkansas. The government was represented at this hearing by Assistant Attorney General Willis N. Mills of Washington, D. C.; J. A. Tellier, also special assistant to the attorney general of Little Rock, and W. H. Martin, United States district attorney for the eastern District of Arkansas. The lumber company was represented by Coleman & Lewis. attorneys, of Little Rock, and Judge Allen Hughes of Memphis, Tenn. It is expected that Judge Trieber will render a decision in the case within the next few days.

This case will set a precedent for the other cases involving the title to all the lands similarly situated, and when it is reached by the United States Supreme Court, will virtually determine the question raised in all these various suits. The particular case now under consideration involves the title to some 900 acres of land in Mississippi county. Arkansas, and commonly known as Moon Lake.

-----> WISCONSIN ≺=

The North End Furniture Company of Milwaukee has been incorporated with \$15,000 capital. The incorporators are H. C. Elwing, George Deppish, H. B. Moormann and George Diederich.

Articles of incorporation of the Doyon & Rayne Lumber Company of Albany have been filed, with a capital stock of \$15,000. M. M. Doyon, B. H. Doyon and George I. Rayne are the incorporators.

The Wood Tire Silo Company has been formed at Sheboygan Falls by II. E. Boldt, Julius Widder and George A. Robbins, with \$20,000 capital. The new company will supplant the Falls Stanchion Company, which is owned by the same persons. It will specialize in wooden silos and continue the manufacture of stanchions, water tanks, barn equipment and other former products. New additions have just been completed, being a 48x64 factory building and a 22x96 warehouse, both one story and of wood. The incorporators, as named, are president, vice president and manager, and secretary and treasurer, respectively. The new concern will triple the former output.

The Kiel Woodenware Company of Kiel has purchased the buildings, machinery and material of the Campbellsport Woodenware Company at Campbellsport. The Kiel concern, which conducts one of the largest box factories in the state, will equip the plant with some new machinery and modern appliances used in manufacturing cheese boxes. The buildings of the plant include a two-story factory, brick boiler and engine room and a large warehouse, all erected during the past five years. There are also logs and bolts on the grounds. The Kiel Woodenware Company owns a large

tract of timber in the northern part of the fate and operates a large saw and geneer mill at Mellon.

The stockholders of the Vesper Wood Mar its turing Company of Vesper voted to Increase the capital stock from \$10,000 to \$50,000 at the annual meeting. The volume of besiness during it just year was reported a third greater than during the previous similar period. D. McVlear was elected president, W. H. Ludwig, vice-president, and E. C. Bennett, secretary-

At the annual meeting of the stockholders of the Merrill Woodenware Company of Merrill the following directors were elected: J. A. Emerlch, president-manager; A. B. Nelson, vice-president; E. H. Staats, treasurer; H. H. Hoffman, secretary, and Matt Tockley. The Woodenware company recently purchased the Meyer box factory and site and will operate the same as soon as sufficient logs can be secured. It is planned to erect a new factory in due time for the manufacture of cheese boxes.

The Keith & Hiles Lumber Company, which is logging extensively this winter and will cut sufficient timber for a long run, has started up its

sawmill at Crandon.

The Arpin Hardwood Lumber Company has three logging camps in operation, with seventy-five more men in the woods than last season. The con-

cern has put on a night crew at the mill at Atlanta

The Willow River Lumber Company is receiving from twenty-five to thirty carloads of logs daily at the Hayward mill. When the bridge is completed it will enable the loading of hardwood logs. Work on repairing and overhauling the mill is progressing and operations will be resumed in several weeks.

The G. W. Jones Lumber Company of Appleton has begun operating its sawmill at Wabeno on the twenty-four hour schedule. Because of the backward season the lumbermen are doubling duty to get sufficient logs to the mill, many of which have been hauled by rail instead of wheels or runners.

The B. Heinemann Lumber Company has started its mill at Wausau for the season. Although logs have been coming in by rail in small lots, the recent snow has improved conditions so that work is resuming normal conditions.

The Washburn Company has shut down its planing mill at Sturgeon Bay after one of the best runs in its history. Although there is sufficient work in sight to keep the mill running, it is necessary to close down for six weeks to give the machinery a thorough overhauling and install a new boiler and engine

The Doyon & Rayne Lumber Company of Madison has filed an amendment to its articles of incorporation increasing its capital stock from \$17,000 to \$75,000.

A deal has been consummated at Beaver Dam whereby Edward O. Sied-schlag & Co. of that city take possession of the Variety Wood Works plant located on East Third street. It is understood that the plant is to be enlarged, additional machinery installed, and operated by the new owners.

A new woodworking industry has been started in Appleton for the manufacture of wood hoops. It is the Millard-Chase Manufacturing Company, whose plant was brought to this city through the efforts of the Commercial Club. Quarters have been secured in a vacant factory and operations begun three weeks ago, with a daily capacity of 20,000 hoops. Fifteen racking machines are being used. At the present time the hoops are sent to Bay City to be planed, but planers will be installed shortly and the output increased to 50,000 hoops daily.

The mammoth plant of the Hamilton Manufacturing Company of Two Rivers, ploneer wood type manufacturer, will be enlarged by the erection of an addition. This will be an L-shaped structure 200 feet long and 60 feet wide, four stories high, of steel, concrete and brick construction. The old sash and blind factory in which the company began operations will be razed to make room for the new building. The force will be increased to 1,000 men.

The Foster-Mueller Lumber Company of Hiles is erecting a modern plant to be used as a flooring factory. The structure will be 90 by 110 feet and will be equipped with electrically driven machinery. The dry kiln will be 220 by 20 feet.

The James Manufacturing Company, Fort Atkinson, is contemplating the erection of an addition to its plant. It is to be of brick and concrete construction, two stories high, 132 by 154 feet, and cost \$20,000.

The Western Parlor Frame Company of Plymouth has filed an amendment to its articles of incorporation changing its name to the Maxwell Company and empowering it to manufacture automobile and carriage hearse bodies. The concern is capitalized at \$25,000. E. Maxwell of that city is president and Edgar Roth of Cedarburg secretary-treasures.

Upward of 1,000,000 trees will be planted by the Wisconsin State Forestry Board on the state reserve this spring. The Trout Lake nursery will furnish 1,200,000 trees, but 100,000 of these will be planted in state parks, and private owners will purchase about 100,000. Last year only about 100,000 trees were planted on the reserve. This year the planting will be mainly in Vilas and Oneida counties and will cover practically 1,200 acres. The new Tomahawk Lake nursery will be opened this spring.

The Heineman Lumber Company of Merrill has inaugurated a feature that will no doubt prove a fixture and of lasting importance in securing more pleasing relations between employer and employe, in the form of a dinner given the heads of departments. The first dinner was given Monday evening, January 19, at the Lincoln, and it is contemplated to make these meetings monthly affairs and to include both day and night men. W. H. McDonald of Wausau was the principal speaker.

TROUBLE?

Are you having any lumber trouble?

Does your oak warp, split, check or honeycomb in the kiln?

Does your gum stain, buckle, twist or do the bucking broncho act?

Do you have any difficulty with split panels and defective glue joints?

Do you have to dye, stain or refill your lumber to get a uniform color?

Do you have any reclaims on finished goods from bad glue joints, finish or other reasons?

You can cure all your lumber troubles by using

Kraetzer-cure

TRADE MARK

You don't have to buy Kraetzer-Cured Lumber—you can produce it yourself from air-dried, half-dry or green stock.

Your lumber will then dry in your kilns quick, straight and free of all defects.

We will tell you where to buy Kraetzer-Cured Lumber, if you ask us.

We will tell you about the Kraetzer Preparator, the use of which insures the quick and accurate seasoning of lumber, if you ask us.

We will send you a new and interesting pamphlet involving the entire theory and practice of steaming wood under pressure, if you ask us.

ASK US

The Kraetzer Company
537 S. Dearborn St., CHICAGO

The Kenteld Lamoreaux Company of Washburn has closed negotiations for the purchase of a large tract of timber in the vicinity of Herbster, this county. It is estimated that there is probably a ten years' supply in that vicinity, which will mean operations at the local plant for many years. Moon 100 mean are already engaged in the woods. The logs are dumped into the lake and will be rafted to this city to be manufactured at Washburn.

The Holt Lumber Company has started its sawmill at Oconto with about 200 men at work. The plant was shut down for several weeks for repairs, but is now working at expactive.

The Hardwood Market

=≺ CHICAGO ≻=

Chicago usually seems to bear the brunt of any unfavorable developments, and this condition is now apparent, comparing the Chicago market situation with that of other hardwood centers of importance. It is not to be inferred from this that the Chicago trade is as a general thing in a pessimistic mood. but it is as a general thing more difficult to realize fair values for stocks in Chicago at present than in other centers. This is particularly true, it seems, with oak, which is actually selling considerably off in Chicago territory. There is, however, a better tone with some of the other woods, especially those going into box manufacture, as the box trade seems to be doing more than its share in holding up the general lumber market. There doesn't seem to be any really tangible reason why trade shouldn't be good in Chicago right now, as the furniture men are in fairly good mood after the exposition, and with plentiful money building operations are going ahead on a generous basis. The fact remains, however, that the Chicago trade is not in as cheerful a humor as it might be, but there is by no means a preponderance of direful predictions as to the future. It is confidently expected that the somewhat delayed development of the better conditions which have been promised will be apparent before very long. This prediction and hope seems to be borne out by really sound economic factors.

The safest thing to say of the Chicago market at present is that the best prediction can be made within a few weeks from now, when it will be seen just how rapidly the improvement will develop.

=**≺** NEW YORK **>**=

There is a decided tone of improvement in the local hardwood market and it would be hard to find a dealer who is not confident of good business from now on. The volume is still away below normal, but prices have firmed up considerably and with the exception of gum there are few concessions. It is realized now that stocks at mill points are not as heavy as might have been expected, and rather than be caught short some buyers are placing business for future delivery. The wholesalers are not as anxious for this kind of business as they were sixty days ago, because of the tendency towards higher prices. The conservative traders are hoping for a slow and steady return to normal demand and higher prices, and it seems now that this will be realized. One thing of favorable note is the talk among the trade—all are of the opinion that the dull season is at its end. And when they talk this way it usually develops in kind.

==< BUFFALO **>**=

The hardwood market shows some improvement, and trade covers a pretty fair number of woods. January business at most yards shows a fair increase over the preceding month, while some dealers say that there was decided improvement. One good feature of the situation is the tendency to buy in larger amounts, which indicates that purchasers of hardwoods have allowed their supplies on hand to dwindle considerably. Prices are not up to any extent, compared with last month, and the desire to turn over stock makes some pretty low quotations at times.

The chief demand is in plain oak, maple and one or two other woods, although sales are well distributed over most of the list. Oak manufacturers say they are not willing to take orders for an indefinite period ahead at present figures, for they believe there will soon be an improvement and that lumber will be worth a good deal more than at present. Dealers are generally in favor of holding tight to stock, rather than to sacrifice it, and they are usually in position to be able to wait.

=< PHILADELPHIA >=

With the exception of a slightly firmer market, there is no discernible change in the hardwood lumber situation from a fortnight ago. More liberal inquiries are reported, and in some lines an increase of orders; but on the whole an unbroken conservatism continues to be the rule. As to outlook, a persistent optimism prevails generally. While a boom or sudden rush of prosperity is not anticipated, it is the opinion of the logical and countious merchants that a sane and substantial business beginning with March may be looked for during 1914, a prediction which is fortified by the general state of the lumber pile both at the manufacturing and consuming end. There are still a number who preserve a pessimistic attitude, but they belong invariably to the class of doubters who, as John T. Riley of Charles S. Riley & Co. says, "blow out the condict to see if it is dark." Market quotations continue about as pre-

who sky reported to take to a control of the contro

→ ✓ PITTSBURGH > Trade is opening up slow volets as a project of volet in number to be I that 1911 has a per an second second in the contract of the contract o

feature of the supplied sort only contracting for half or two-thirds the amount of stock that they used last year. Other small concerns are taking about the usual amount for the year. Deliverles on these contracts are not being heard, and in fact most of the concerns seem to prefer to wait until spring before receiving any large amount of lance to the torus ppward. No changes of importance have been announced so far, but the stiffening in inquiries is affecting manufacturers whose stocks are not everly large and who look for high started as yet, and while building operations are looking up, it is a little too early to make any predictions along this line

====**≺** BALTIMORE **>**=

The hardwood situation appears to be somewhat mixed just at present. reports about the state of the trade being rather conflicting. Some of the wholesalers state that they have struck a half in their efforts to place stocks, while others say the volume of business done by them is quite satisfactory and that some improvement has been noted of late, The former also state that the offerings are quite liberal and that considerable pressure upon the market is encountered. The prepond rance of opinion, however, appears to be that even though no decided improvement is to be shown, conditions are better than they have been, with buyers disposed to take stocks in fairly large quantities and with conaderable freedom. This condition may not be general, but it appears to hold good with respect to certain sections. Concerns with Canadian connections, for instance, find that the demand there is quite active and shows positive expansion, after a period when business was none too good, and when the Dominion suffered from tightness of money and from over-investments. It is also to be said that trade in the New England section also has picked up, though, of course, for the present, no big gains

Locally, the situation is about stationary with the requirements up to what might be looked for at this season, and with prices little changed. The lower grades of poplar are still quiet, almost dull, while certain divisions of the chestnut business have reached a point rather close to duliness or even stagnation. These grades of chestnut are either in such large supply that a recession in prices has resulted, or the wants of the buyers have narrowed; but whatever the cause, they excite no interest, and the laquiries of sellers meet with discouraging results. Oak is about holding its own, with the lower grades moderately easy, but with the demand sufficiently brisk to avert any further easing off and with occasional signs of better things ahead. To be sure, the climatic conditions have been such that the mills found it possible to continue operations almost without interruption, and an exceptionally large quantity of lumber has been made during the winter, while the ordinary causes that restrict the consumption have asserted themselves. But in some directions an Improvement so far as the needs of the trade are concerned has asserted itself, and troublesome accumulations have been averted. The exporters are in an expectant state. They have not so far been called on to greatly increase their forwardings, but the outlook abroad is deemed appreclably better, with stocks reduced and the foreign buyers disposed to meet the figures of the shippers. Oak planks and other items are in better shape, and the movement later on is expected to obtain impressive proportions.

----≺ COLUMBUS ≻---

Hardwood trade in Columbus and central Ohio has ruled steady during the past fortnight. There is a slight increase in the volume of business and prices as a whole have been well maintained. The tone of the market Is good and future prospects are believed to be bright. Shipments are coming out well as the car supply is adequate for all needs. Collections are improving in most sections of the country.

One of the best features of the trade is the better demand on the part of retailers. After their inventories it was found that yard stocks are generally light and dealers are inclined to stock up a little to be prepared for the rush when it comes. All grades are in demand, as stocks were pretty well depleted.

Factory demand is also holding up well and the volume of business appears to be increasing. There is a good demand for materials from vehicle and implement concerns. Furniture factories are expected to be in the market after the show period. Materials on hands by factories are generally light, although they are buying only what they desire for immediate needs.

Indications are bright for active building operations in the spring, as architects and builders are busy on plans and figures. This is expected to aid the market as many of the structures are dwellings and apartments. Country retailers expect a good demand as there will be considerable building in rural sections. .

Quartered oak is firm and prices are at the same level which has prevailed. Plain oak is also strong. Chestnut is another strong point in the market. Poplar is becoming firmer all along the line. Basswood and ash are both being well maintained. Other hardwoods are unchanged.

We offer the following stock of our own production, from good logs. Consists of good widths and lengths. Is band sawn and carefully edged and trimmed.

• Indicates stock dry enough to ship within 60 days; remainder of items ready for immediate shipment. The item of Core Stock is a special grade, suitable for veneering over. This is thoroughly dry and we are prepared to quote an attractive price.
All Red and Sap Gum in grades of No. 1 Common and Better is Kraetzer-Cured, insuring the lumber to remain straight and tlat and to be absolutely free from stain. Kraetzer-Cured Lumber is of a soft, mild texture and uniform color.

We have facilities for kiln-drying and surfacing. We specialize on Oak timbers, switch and crossties, car stock, bridge and crossing plank.

VIEW OF MILL SKIDWAY, WITH PART OF LOGS STORED IN BACKGROUND—WE HAVE 6,000,000 FEET OF SELECTED HARDWOOD LOGS STORED ON OUR MILL YARD.

≺ CINCINNATI >=

Among lumber dealers there is the strongest feeling of eptinds in noticed for many months. There is no question of it demand increasing as the season advances, and trade just at this time is quite satisfactory. Prices have been a little off, but not much stock has been shipped by the manufacturers, who have been onto their job, as they did not care to accept business except on a reasonable basis; and the small producer with his poorly manufactured stock has had his inning; but the increasing demand forecasts the opportunity of the legitimate manufacturer of hardwoods who makes the grade satisfactory and furnishes stock that is right.

The rush has not arrived as yet, but it is coming. Factories are beginning to start up in this section—that is, the few that have been shut down entirely—and the balance, that have been running on short time, are preparing for a much more liberal run. Dealers claim that there are more inquiries now than for the last several months, and much stock is moving as the result of recent ordering. Most of the old orders are practically filled. New business during the last few months has been highly scarce, but the silver lining to the clouds is now visible on the horizon and dealers are a unit in anticipating nothing else but fair business for the immediate future and fully expect if to grow steadily better as the season advances. This applies to quantities as well as prices.

—≺ TOLEDO >=

The present prospects of the local hardwood market are only fair. Prices are, however, holding their own, although lumber is being moved but slowly. The continued warm temperatures have softened the roads to such an extent that hauling is extremely difficult. Builders are taking advantage of the mild weather and are hastening their work. The big boon: in construction work of all kinds already outlined for the spring is the redeeming feature of the present situation and hardwood dealers are very optimistic. The fature does indeed look "rosy" for the Toledo business.

=< INDIANAPOLIS >=

Hardwood lumbermen say that the spring outlook is brightening daily he number of inquiries that are being received is very encouraging and a number of very substantial orders have been placed. Business, of course, Is still below normal, but it is not believed this condition of affairs will long continue.

There is no complaint of car shortage, as receipts are arriving promptly and shipments are being cared for without delay. Prices are remaining steady. A large business is not expected during the next few months, but It is thought the volume of trade will not be below that of the same season of last year.

=-< MEMPHIS ≻=

There is an increasing demand for hardwood lumber here and the market continues to show a better tone. Shipments during the latter half of January were appreciably larger than those during the first half of that month and February has opened with a better run of orders than was noted for the last fortnight in the preceding month. There is a growing belief in greater activity in practically all lines. This is borne out by the larger business which is actually taking place, and lumbermen believe that they are on the eve of a period of greater prosperity than they have witnessed for some time. There have been few advances in prices since the first of the year, though it may be noted that the lower grades of both cottonwood and gum are commanding better values than at that time. The low water in the Mississippi and its tributaries is affecting the movement of both cottonwood and gum, and one of the largest box manufacturers here is authority for the statement that offerings are rather restricted and that the tendency of prices is somewhat better. It may be noted in the same connection that the box factories are doing a large business and that their needs are quite full.

There is a good call for sap gum in the higher grades and values are well maintained. Red gum continues rather slow. Oak is selling in all grades of both red and white, while there is no difficulty in disposing of ash at satisfactory prices. The upper grades of cypress are relatively low, but there is a good demand for selects and shops, and prices are well held. The upper grades of cottonwood are affected by the scarcity of this material, particularly for future needs, and holders are disposed to ask somewhat fuller prices. Export business is comparatively slow at the moment and the prospects are not particularly brilliant at the moment for any decided improvement in that quarter, largely because of the consigned stocks on the other side, the tightness of money in some of the leading continental centres, the keen competition from Japanese and Russian manufacturers of hardwood lumber, and the high ocean freight rates on American exports via New Orleans. Exporters are proceeding on the theory, however, that there will be some improvement later, and they are getting their stock lists in good shape against the demand which they believe will materialize.

=≺ NASHVILLE >=

Hardwood dealers closed up January with a very satisfactory volume of trade, reporting business about the same as for January of last year. Prices rule about steady on hardwoods, none of the big firms conceding any reduction of prices. Quartered oak has been growing scarce on this market, with active demand. Plain oak is in good demand. Some busi-

Mahogany and Circassian Lumber & Veneers

¶ The largest assortment of finest figured Mahogany Logs, Lumber and Veneers in the country can be found at the Chicago plant of C. L. Willey.

¶ We are just in receipt of fifteen cars of remarkably superior Circassian Walnut Logs, large size, well-figured and of good color, which are now being cut into Veneers.

¶ A visit or correspondence from discriminating buyers of all varieties of fine Imported and Domestic Cabinet Woods in Lumber and Veneer is solicited.

¶ You will not only find the Willey warehouses well stocked with a superb collection of Circassian, Mahogany, Vermilion, Black Walnut and other fancy foreign and domestic lumber and veneers, but buyers are assured of prompt and painstaking service, and a quality of product not usually obtainable.

¶ To visit the plant take Blue Island Ave. car at the postoffice to Robey Street.

mess to being handled in boolar, chestrat, ash, hickory and other lines Mere imparities are being received, and jobbers are expecting gradual ingrovement of trade the next few months.

=< BRISTOL **>**=

Bristol lumbermen report business holding its own, with better prospoets for spring trade. Business is declared to be somewhat better since the first of the year, but it has been hardly as brisk as lumbermen had anticipated that it would be. The mills in this section have run pretty regularly during the cold season and the volume of shipments has been h avy, due largely to the fact that much business was booked ahead There is new unusual activity in manufacturing for this season of the year and the prospects for trade are considered as most encouraging.

==≺ LOUISVILLE >=

January was as good a month as was expected by hardwood men in this market, and February is showing a gradual improvement which promises to be marked before the end of the month. The practical completion of the furniture shows, the end of the inventory period, and similar factors have resulted in buyers being more inclined to order than they have been Some railroad business has come into the market, and this heretofore. indicates that an avenue of consumption which has been almost closed for some time will be opened in accustomed volume. The demand for quartered oak is holding up well. Plain oak is selling fairly well, though not so well in proportion as quartered. Hickory is picking up somewhat. Chestnut continues generally quiet, except sound wormy. Poplar is not going very rapidly, but the general tone of the poplar market is showing

=**≺** ST. LOUIS **>**=

But little change has been noticeable in the hardwood market during the past few days. Stocks in the hands of the distributors here are in pretty good shape and are fully ample for all the requirements that may be made on them for a while or until the trade shows more briskness There is still an excellent demand for plain sawed oak, and ash and poplar are showing more life. Wide poplar boards are in particularly good demand. There is a fairly large movement of red gum reported and prices on the upper grades are higher. The upper grades of cottonwood are showing more life than they have for some time. The lower grades are also showing improvement. As to cypress, that wood is only in fair demand and prices are holding up. It is the consensus of opinion that there will be a decided advance in prices on many items that are scarce, as soon as the demand from the North and Northeast increases, which is predicted will come in the very near future.

=< MILWAUKEE ≻=

The interest of the lumber trade is centered just at the present time in northern Wisconsin and Michigan, where the slow progress being made in logging operations is causing considerable concern. There has been more activity in the lumber country during the past week, as a result of more snow and colder weather, but lumbermen say that unless several weeks of favorable weather are experienced the log output is bound to show a decrease this season. Camps were opened early in the fall and there was considerable timber cut, but up to a week or so ago there has been very little timber started to the mills. Hauling and skidding was almost impossible because of the soft weather, and only those concerns which were fortunate in being able to log near a rallroad were able to ship many logs. Considering the general scarcity of stocks at the present time. lumbermen say that there is sure to be a serious shortage of dry hardwoods next spring. Sawyers and other woodsmen are beginning to leave the camps, as most of the lumber concerns are not giving their entire attention to the work of rushing the logs out of the woods and to the sidings.

The trade outlook for the coming season seems to be growing brighter daily. General business is showing steady improvement in Milwaukee and about the state, and this is bound to react favorably upon the lumber trade. Most of the big manufacturing concerns of Milwaukce are taking on more men and are beginning to operate at normal capacity once more.

Indications are that a new high building record will be established in Milwaukee this year. During the month of January, Building Inspector W. D. Harper issued eighty-two permits for the erection of buildings to cost \$342,858, as compared with seventy-five permits, representing an investment of \$266,446, during the corresponding period in 1913. Inspector Harper is confident that the building investment for 1914 will amount to \$19,000,000.

Milwaukee wholesalers are expected to meet with a substantial increase in business this month. The annual convention of the Wisconsin Retail Lumber Dealers' Association will be held in this city, February 17, 18 and 19, and a large attendance is expected. Dealers always take the opportunity to place some good orders when in the city to attend these annual conven-Most retailers are anxious to get their orders for stocks placed before higher prices are experienced and before stocks get any lower. There is still a tendency on the part of factory consumers to place orders for only enough stock to meet their present requirements. Stocks in the hands of these concerns are light, however, and a better business from this source is expected soon. Stocks of maple, birch and basswood are light and there is a tendency toward higher prices in these woods. Plain oak is still in leading demand among the southern woods.

THE RUSSEL COMBINED SKIDDER AND LOADER IN OPERATION

Russel Logging Cars are built to stand severe service, of any capacity desired or to suit any length of log.

Logging Economy will interest you

The most convincing proof of any machine's efficiency, next to a personal trial, is the expression of those who have used them.

We shall be pleased to furnish you with the proofs or the names of the operators who will be glad to show you the machines in operation.

The Russel Combined Skidder and Loader has demonstrated itself to be superior in design and construction. The great decrease in cost and increased efficiency of logging is bound to appeal to the operators.

VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer. Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of-every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

Veneers and Panels with a Reputation

WE manufacture Veneers in all the native woods and for all purposes. Also Built-up Panels in native and foreign woods—three and five-ply—and have established a reputation for furnishing high-grade material. Send us your inquiries and orders and become one of our satisfied customers.

Underwood Veneer Co.

Wausau, Wis.

Custom Mill Work, Storage, Inspection

ON

Foreign Fancy Woods, Mahogany, Cedar, Circassian

We receive the logs, store or warehouse them, manufacture them into lumber, cut or saw veneers, pile and store the product, and ship via any railroad. Also furnish inspection returns on logs or lumber. Can furnish accommodations and economies which it is impossible to secure elsewhere. We always have on our yards parcels of plain and figured African, Mexican and Cuban Mahogany, Circassian Walnut and Cedar logs, placed here for sale by direct foreign shippers, from which advantageous purchases can be made.

BAY CITY, MICH.

HARDWOOD GATEWAY OF THE SOUTH

Can You Use This Lumber?

If the stock listed below appeals to you, it may be had at an unusually favorable price at this time for immediate delivery. The lumber consists of dry, well-manufactured stock, and in case special requirements as to widths and lengths are in mind, a description of the items will be cheerfully given to any who are interested. Factory men requiring mixed carloads are reminded of the co-operative arrangement existing among the firms named below, whereby cars containing stock from a number of houses will be loaded by them, so that, in effect, the entire hardwood stocks of Louisville are available for the needs of the small buyer.

UR DOUBLE BAND MILL-HUTTIG, ARK.

Why We Can Give "Value Received"

We own one hundred thousand acres of the best virgin Southern Hardwood timber.

We operate large band mills at Huttig, Ark., and Deer-

We cut FORTY MILLION feet of hardwoods annually and carry 15,000,000 feet IN STACK.

We sell only stock cut on our own mills and so can GUAR-ANTEE the quality of EVERY shipment.

We ship high grades that increase the size and percentage of your cuttings, reduce factory costs and shrink the waste pile. Therefore:

We can SAVE YOU MONEY on every shipment of oak, ash, gum, elm, cypress, tupelo, hickory, cottonwood, sycamore, soft maple and dimension.

LET US PROVE THIS ON YOUR NEXT ORDER

Wisconsin Lumber Company Harvester Bldg. CHICAGO

A floor to adore

For thirty-three years Wilce's Hardwood Floering has been among the foremost on the market and because it stands today "unequated" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free

The T. Wilce Company

22nd and Throop Sts. CHICAGO, ILL.

CHOICE BIRCH AND MAPLE-10,500 ACRES

I offer the above tract of best quality and splendidly located timber in Ontario, ten miles from Sault Ste. Marie, Ontario, a town of 25,000 population. Will cut 90% birch and maple. Estimated by George F. Beardsley, cruiser of Grand Rapids, Mich. Location and mill site on deep water. Can ship either by water or rail. Lands in fee simple—no crown dues, no export restrictions. Close to American Soo. Easy logging. Reasonable price and terms.

William H. Ranson, Sault Ste Marie, Mich.

SAVE YOUR MONEY BY USING THE

RED BOOK Published Semi-annually in February and August

It contains a carefully prepared list of the buyers of lumber in car lots, both among the dealers and manufacturers.

The book indicates their financial standing and manner of meeting obligations. Covers the United States, Alberta, Manletoba and Saskatchewan. The trade recognizes this book as the authority on the lines it covers.

A well organized Collection Department is also operated and the same is eyen to you. Write for terms.

Review and Outlook

General Market Conditions

WHILE THE TRADE IN THE MIDDLE WEST and in the East are not distinctly or closely allied, still the middlewestern sections watch conditions as they develop in the East pretty closely, and are right now experiencing some uneasiness on account of the slackening of trade in the eastern sections. This condition is reported from practically all of the larger eastern markets, and while it is a condition which is an actual fact. the circumstances should not tend to create any undue pessimism or to disrupt the market in any way. It is firmly a fact that there is no reason for breaking in prices or for any kind of a feeling of uneasiness, as there is every reason for a distinctly hopeful outlook, even though conditions have not materialized as yet this year as it was expected they would develop. It is rather difficult to lay one's fingers on the actual reason for the holding back in the call for lumber stocks, and the repeatedly expressed anticipation of an early opening up seems to be entirely justified and instifiable.

As is the impression in the individual sections, looking at the matter purely from a general basis, the untoward weather conditions which have prevailed all over the country for several weeks past have been a very serious retardent in the development of the lumber market; also the fact that the Interstate Commerce Commission has not been able to hand down a decision regarding the five per cent increase in freight rates has had something to do with the situation. These two circumstances taken together should easily account for the fact that business continues to drag comewhat, and should be an explanation which should be entirely satisfactory to the lumber trade in so far as eliminating any doubt as to the future development of the business is concerned.

Of course, it is a fact that since the first of the year predictions have been everywhere forthcoming that there would be an early and entirely satisfactory awakening in demand. It is also a fact that these predictions have not entirely materialized, although it is further true that in some sections the most favorable reports are emanating as to business that has actually transpired and is now being done. Still on the whole business has not opened up as it was anticipated it would, which is no reason, however, to believe that the next few weeks will not see a decided awakening in the demand for all kinds of lumber products.

The two most important consuming factors, the railroads and the building trades, are being retarded primarily by the conditions before noted. The first of these, that is, poor weather, will shortly be removed, and judging from reports of building permits issued in almost all of the large cities, there will be a great activity

in this line. As to the railroads, it seems almost certain that they will secure their five per cent increase. In fact, they have been getting into line on orders for rolling stock and motive power quite actively, seemingly in the belief that their requests will be granted. It is anticipated that while they will not get actively into the market until the actual decision is handed down, there will be some little tendency to loosen up, which tendency has already been noted.

Of course, with increased activity in the building trades, there will be an increased call from the factory trades to take care of furnishings for such structures as are erected. Thus the situation seems to have a decidedly favorable outlook.

It is true that the export situation is not what it should be. Conditions abroad are evidently continuing on a much more unsatisfactory basis, generally speaking, than they are in this country. As to the lumber business, there is a really congested market abroad, with a very considerable quantity of consignment shipments which are not tending to improve the situation at all, but are having their direct effect in the matter of continuing to hold prices down to the minimum. It is surely to be regretted that such shipments continue to be made on as broad a basis as they are, considering the facts that are so apparent.

Regarding the relative standing of the various woods, nothing of note has transpired to change their respective positions. Oak is somewhat off in some markets, but it is probably true that such a condition is more the result of offerings on the part of concerns heavily stocked in this class of lumber who desire to turn over some ready money. In the main large oak stocks are firmly held.

The box manufacturers in all sections are contributing more than their share to the demand for all kinds of low-grade stocks, which has apparently cleaned out low grades in certain items. Sap gum is strong, as are cottonwood, poplar and other box lumber. Red gum does not show any material strengthening, but it is a notable fact that it has not shown any further weakening. No definite change can be seen in the more minor species.

It is probably a fact that northern woods are a little stronger than southern woods at this time, although there has been some little tendency to offer stocks at below prevailing prices. In view of the poor prospects for the supply of northern woods for the coming spring, however, this tendency seems altogether unwarranted and inexcusable.

Putting the situation conservatively, there is certainly no reason to believe that the immediate future of the hardwood business will be unfavorable. In fact, there is every logical reason to believe that the developments in the immediate future will be decidedly to the advantage of hardwood operators in all sections.

The Mountain Path

THE PICTURE ON THE FRONT COVER of this number of HARDWOOD RECORD shows a path through the woods. The path is evidently new, and that is the interesting part. It is on the west side of Massanutten mountain, Rockingham county, Virginia, and was recently constructed by the United States Forest Service at a cost of thirty-five dollars a mile. It is part of the improvements which the government is making on the lands lately bought to form the system of Appalachian National Forests. This particular tract lies within two hours' ride by rail of the city of Washington.

It may be a matter of surprise that waste land in sufficient tracts to form a government forest could be found so near the nation's capital; but the land was there, and was purchased at a low price. It is cut over and partly denuded, with small, worn-out and abandoned clearings interspersed. The particular tract shown in the picture contains a promising stand of young hardwood, but no old timber is visible. Many thousands of acres of such land have been bought by the government among the eastern mountains. For the most part, they are tracts which the owners were unwilling to improve or protect, and they were deteriorating from periodic fires and by the ceaseless erosion caused by storms.

In most instances, the only measure needed to bring back the forests is to keep fires out. The small trees will then grow; seeds will be planted in nature's various ways; the annual fall of leaves and the decay of weeds will slowly renew the soil's fertility; and in time the timber will become valuable, and under the care which the forests will receive, they will perpetually remain valuable.

One of the first improvements which the Forest Service undertakes when it purchases these appromising lands, is to construct trails in various directions through them. These paths become strategic lines in fighting fire. The men can move more quickly to the threatened areas, and can generally head off the fires before they gain much headway.

In addition to furnishing facilities for rapid movement and concentration of forces in fire fighting, the paths are valuable in the transaction of the business of the region, both by those in charge of forest work and by citizens who have occasion to pass to and fro on business or pleasure. Many an old resident has expressed surprise at the easy grades which forest engineers have found for the trails among the mountains. The pioneers made their paths up and down steep ridges and narrow backbones because brush was thinner and less troublesome there; and some such trails have been in use ever since, and not infrequently they have been widened and have become highways-following up and down hills as the path did a century before. The Forest Service's easy grades round hills instead of the unspeakable grades over them have opened the eyes of many a mountaineer who did not know that a potbail is no shorter standing up than lying down.

The buying of the land by the government to establish forests in the East is about at an end unless Congress makes another appropriation for that purpose. It is understood that the fund provided some years ago for purchasing such land is nearly exhausted. Purchases are said to approximate 1,000,000 acres, and the average price has not exceeded six dollars an acre, including considerable bodies of land containing a fair amount of timber. Friends of the Forest Service in Congress are proud of the excellent showing made in the purchase and improvement of lands in New England and in the southern Appalachians, and there is little doubt that means will be provided to continue the good work. It is coming to be better understood that the Forest Service is not a purely western affair, but is national in its scope.

Annual Wood Manufactures

N ARTICLE IN THIS ISSUE of HARDWOOD RECORD gives government statistics on the annual use of wood for manufacturing purposes in the United States. No similar figures were ever before available, and for that reason the statistics are of exceptional interest and value. The yearly cut of lumber has been published regularly for many years, but the information went no further. No one knew how much of the lumber was used in the rough and how much was further manufactured before it reached the ultimate con-

sumer. It has been known for some time that the Forest Service was at work on the problem of determining how much of the annual cut of wood reaches factories to be converted into finished products. That information has now been made public, and doubtless many persons will be surprised that sixty per cent of the rough lumber is not used until after it has been converted into manufactured articles. Different states play a very unequal part in this manufacturing. The largest producers of rough lumber are not usually the most important in further manufacture. The close relationship between utilization and diversified markets is shown. The race for supremacy in quantity of material used in wood-manufacturing, with Illinois, New York and Pennsylvania far in the lead of all other competitors. has apparently been settled in favor of Pennsylvania. Illinois stands second, New York third; but Illinois leads in the number of woodusing industries, New York is second, and Pennsylvania third. These three states do more than one-fifth of all the wood manufacturing in the United States.

A Boost for Hardwood

 $T^{
m HE}$ USE OF HARDWOODS in modern mantel construction has not been any too prominent of recent years. Hence, the action taken at a recent meeting of mantel and tile dealers at New Orleans will be particularly gratifying to those in a position to supply mantel manufacturers with their raw material. An open discussion on the question of hardwood mantels was a feature of this meeting, and it seems that as a result hardwood mantels will be brought back to their proper position as an important part of the modern home.

It is interesting to note that in the discussion, the consensus of opinion was developed indicating that the hardwood trade has not been alive to its opportunities or to the necessity for creating new designs and new ideas in mantel furniture. On the other hand, manufacturing concerns of competing materials have kept abreast of the times and as a consequence have taken a large proportion of the market. However, it seems that the hardwood industry has a strong ally in this association which went on record as favoring the sponsoring of the cause of the hardwood mantel, and is making every effort to re-introduce it as an essential feature of the modern home.

While the lumber trade cannot take credit for any favorable results which might be felt, it has just reason to be extremely glad of its occurrence.

Delivery of Lumber Shipments

ERTAIN LEGAL PRINCIPLES which are applicable to every CERTAIN LEGAL PRINCIPLES when an applied by the shipment of lumber or other freight were recently applied by the Supreme Court of Georgia. The rules laid down by the court, being in accordance with the decisions of the appellate courts of other states, will prove of interest to lumber shippers throughout the country.

The first point decided is that when lumber is shipped in carload lots and the consignee is given notice of the arrival of the freight at its destination, his failure to receive and unload it within a reasonable time, the strict liability of the carrying railway company as common carrier ends, and its less strict responsibility as warehouseman arises. The importance of this point lies in the fact that a carrier is virtually insurer of the safety of freight while in its hands, being liable even for loss through accidental fires not attributable to any active negligence on its part, and for any loss or damage not resulting from fault of the shipper or unavoidable calamity, such as an unprecedented storm. On the other hand, a warehouseman is liable only for losses which are traceable to negligence on his part. Thus, if a shipment of lumber is accidentally destroyed while in the delivering railway company's hands, but before the consignee has been notified of its arrival, and has had time to receive it, the loss falls on the railway company, unless it can show that the loss resulted from what is termed in law an "act of God." That the fire was caused by an incendiary or by fault of a third person is no defense. On the other hand, if the consignee has been notified of the arrival of the shipment and the loss occurs after he has omitted to unload it promptly, he cannot recover without showing negligence on the part of the railway company. The case stands precisely as it would against one who undertakes to store a quantity of lumber, without insurance.

The second point decided in the Georgia case is that, in the absence of any law, valid rule of the nailroad commission, contract or custom raising such a duty, a delivering railway company is not bound, at the request of the consignee, to deliver lumber shipments to another carrier, to be transported to a different part of the same city, where the consignee may desire to reship the lumber. The court said: "It is argued that this works a great hardship on the plaintiff, as he is compelled to pay demurrage, in order to have the cars, which arrive at Savannah loaded with lumber, remain on the tracks of the Seaboard Airline Railway until called for. But the plaintiff is not compelled to do this. He ships the lumber to Savannah. When it arrives at its destination he can receive it. and reship it when he desires to do so. If, instead of unloading the lumber and keeping it in his yard, he prefers to let it remain upon the cars, it is at his desire.'

The precedents thus established certainly constitute still further arguments in favor of prompt handling of shipments upon arrival.

Help for Interstate Commerce Commission

S ENATOR KENYON OF IOWA has submitted a bill to increase the membership of the Interstate Commerce Commission from six to sixteen. The object in view is to assist that body in keeping closer up with its work. Dockets are long and crowded, and con ditions have been growing constantly worse. The business interests of the country want decisions more promptly than they are coming at present. The six members of the present commission have more work than they can do.

The bill introduced by Senator Kenyon contemplates the division of the country into five districts, with headquarters at Washington. Atlanta, Chicago, Kansas City and San Francisco, with the principal office at Chicago. Three commissioners in any district, under the terms of the bill, could decide a case, which could be taken on appeal to the entire commission.

The commission as at present constituted does not want its membership increased, believing that the larger number would be more unwieldly and would hinder rather than help in getting through with the ever-increasing work.

The commission has plans of its own for handling the business, and has taken a step toward putting the plans into execution. It is allowed a contingent fund which it is authorized to expend in advancing its work. It has appointed "a board of examiner attorneys," whose duty it will be to hold hearings after the manner of those held by masters in chancery, and to report on cases direct to the commission, which shall render the final decision. The commission pays the salaries of the additional examiners.

This plan is an experiment. If it proves to be sufficient to solve the problems of clearing the commission's dockets it may continue. If not, some such plan as that embodied in Senator Kenvon's bill will likely be tried. The reasonableness of the demand for more speedy decisions is widely recognized.

The Modern Idea in Lumber Manufacture

GREAT DEAL IS BEING HEARD these days regarding efficiency in manufacture and merchandising, and in general industrial efforts, but it must be confessed that the most conspicuous examples of the gratifying results to be obtained through efficiency are seen in connection with other lines of industrial efforts than lumber manufacture and sales. It is true that concerns in the manufacture of steel products are probably in the forefront in such efficiency activity, both as to the development of the idea and its general application.

A prominent northern lumber operating concern is, however, doing work along these lines which deserves the highest commendation, and which is working out most successfully in developing the greatest efficiency in manufacture and sales methods. The story of these operations will be given in detail in another issue of HARD-WOOD RECORD. The general manager of this operation, which is immense in its scope and compares favorably with any others in the country, conceived the idea sometime ago that the heads of the various departments under him were not closely enough in touch with the

and get-together meetings would result in a more harmonious spirit existing between such departments. He decided to experiment along these lines in the belief that eventually the whole machinery of his organization would work together more smoothly, as the knowledge of the workings of the different departments became a part of the work of the other departments,

One of the first things which was accomplished was the enrollment of the heads of the sales, accounting, manufacturing and similar divisions of the plant, in a well known school of efficiency, these various heads being requested to take up the studies as outlined by that school. The idea immediately took. The result is that a great deal of progress is being made.

On account of the large enrollment, this school agreed to send a special lecturer to the company's main office in Michigan once a week, and in connection with the get-together meetings these lecturers now give regular talks on some special subject which comes up for discussion. In addition to these talks the heads of the different departments are asked, after having inspected other departments, to give criticisms and suggestions for making short cuts. These criticisms and suggestions of course are all made in the proper spirit and are received in the same spirit. The head of the department being criticised is given the opportunity at the succeeding meeting of responding to these criticisms and endeavoring to show where, if possible, the methods in operation are the most practicable. Thus a great many points are brought out in each gathering which mean the saving of actual dollars and cents.

The idea is a broad one, but not too broad to be practicable. That this is true is proven by the unusual success with which it has been attended. It is an idea well worth being followed out by any large manufacturer whose organization comprises a series of departments which are more or less removed from each other.

The Exposition Supported by the Government

HON. JAMES W. FORDNEY, of Michigan, national congressman, recently submitted a joint resolution, H. J. 204, before the House of Representatives, which resolution specifically provides that the Secretary of Agriculture shall be authorized to make exhibits at the Forest Products Exposition to be held at Chicago and New York, and appropriating a sum not to exceed \$10,000 for an exhibit on the part of the Forest Service. The resolution was immediately referred to the Committee on Industrial Arts and Expositions, which committee voted unanimously to support it. There is every reason to believe that the appropriation will be authorized, and hence the Forest Service will have an exhibit at the Forest Products Exposition which will be an unusually interesting and highly educational demonstration of what the service is doing and planning, and will add very greatly to the value and attractiveness of the show.

This effort, if it goes through, will be of great importance as it aligns the government on the side of the lumber trade in the interests of the exposition, and will give to that endeavor an unusual impetus.

Regardless of other attractions which now promise to be of absorbing interest, the exhibit which the Forest Service can make with such an appropriation at hand should be in itself of enough interest that it alone would be well worth the price of the admission.

It has been suggested that everyone interested in the project communicate with representatives at Congress urging that they support the measure when it comes up for vote. While it will probably go through without such communications, it would be decidedly in the interests of the general lumber business to demonstrate to every national representative through this means that the lumber business is awake to its opportunities and realizes the importance to the trade of putting this proposition through in good shape.

Weak Places in Theories

GOOD MANY THINGS work out on paper which do not work A GOOD JANY IHLAND WITH A WAR AND THE PROPERTY classed as theories with weak places. A few concrete examples to the point were contained in a press bulletin recently issued by a well-known and excellent forestry school in an eastern state. The purpose was commendable, the effort praise-worthy, but the conclusions were not all heads of other departments, and he decided that a course of lectures practical. The object was to teach lumbermen to lessen the waste, and, as usual in such cases, Germany was cited as an example worthy of imitation. There ninety-five per cent of the tree is utilized. The stumps are grubbed out, the twigs tied in bundles, and all go to market. The citation is instructive, but the American lumberman cannot sell stumps and twigs at a profit, consequently he will not save them.

The suggestion is offered that sawdust be made into briquettes to be sold as fuel, or that the dust be manufactured into gunpowder. They may do that in Germany, but there is no profit in it in this country: therefore, the lumberman will not do it here.

It is suggested further that small pieces of waste be made into dowels. A single state last year converted 800,000 feet of good lumber into those small pins. The obstacle in the way of converting odds and ends into dowels is the cost. The machines which make these articles cannot profitably handle miscellaneous sizes and shapes of rough material. To do so would increase the cost of dowels above their selling price, and of course no manufacturer would long con tinue to make them under that arrangement.

The proposal to save waste by converting scraps of wood into shuttles, spools, and bobbins overlooks the fact that comparatively few woods are suitable for these articles. Persimmon and dogwood are about the only shuttle materials in America, and not one mill in fifty ever has a pound of either wood in its yard. Spools are as exacting, the small ones being almost wholly of paper birch, and the spool machines will not profitably handle waste, even of this wood. The fact is, the spool factory, which presumably uses as closely as possible, has more waste than a sawmill of the same size. If it cannot work up its own scraps, it is not probable that it would make a success of utilizing another's scrap pile.

Figures of questionable accuracy could be quoted from the same bulletin on the increasing cost of lumber. "Lumber has increased in price thirty per cent every decade for the last fifty years'' is the statement. Unfortunately, there are no authentic and commonly accepted figures showing the average value of lumber fifty years ago in this country; but the Bureau of the Census gives the average mill vard value in 1911 as \$15.05. Figuring that a thirty per cent increase has been added five times to produce that, it is found that the average mill yard value in 1861 was only \$3.92 per thousand feet. It is doubtful if lumber ever had a value so low as that anywhere in the United States: consequently the thirty per cent increase every ten years must be too much.

All efforts to prevent waste should be encouraged, but the fundamental fact must be recognized that no man will trouble himself with preventing waste, unless he can make something by doing it. The theorist may point out how to save material, but the practical man devises ways to save money. As soon as the lumberman or millman can profitably dispose of by-products he will make them, and not before. When population becomes as dense and wood as scarce in this country as they now are in Germany and other countries of western Europe, utilization will be as close here as there; but it is useless to ignore economic conditions. Americans are as well posted as their relatives are on the other side of the sea. Give them a market for products and they will supply the markets. In the lumber business in the United States, the real missionary work lies in the direction of increasing the markets rather than increasing the

Value of Personal Connections

S ALESMANSHIP may be on a more scientific basis than it used to be, and the methods used may be labeled and card-indexed and defined to an extent that was not dreamed of a few years ago; but in spite of this apparent opening of all the sources of information on the subject, it yet remains true that the personality of the salesman is one of the greatest possible factors in getting business. A salesman with an unprepossessing appearance is a rara avis, because of the universal knowledge that selling requires men who are of good appearance and address. The usual description of a good salesman includes the statement that he is "a good mixer," which is merely another way of saying that he understands people and knows how to make them like him; and when this is the case, the strength of the connections between him and his customers is such that it takes pretty sharp competition to cut them.

A lumber salesman recently entertained a big consumer whostopped off in the former's home town to spend a Sunday with him. Business was not mentioned, and it was strictly a social meeting. When a salesman can make friends of his customers and his prospective customers, he has built a foundation which can hardly be undermined. So in stressing all the various qualities that go to make a good man on the road, don't forget that likability, the knowledge of how to approach and win the confidence of others, is, after all, the big asset.

Canada, Beware!

PPARENTLY SATISFIED THAT IT IS USELESS to back A PPAGE ATTA SATISFACE TO THE STATE ATTACHED TO THE STATE OF THE STATE the glowing claims made of eucalyptus as a cureall for all the ills of the lumber business, those promoters behind the development of commercial eucalyptus plantations have started a campaign by securing in a prominent Canadian daily sufficient space to arouse curiosity as to what encalvotus is. In criticizing this feeler, as it might be called, it is needless to analyze it further than to say that it defeats its own purpose by suggesting the growing of eucalyptus in a country which is most apparently not adapted to its best development. The article is couched in very patriotic terms intended to appeal to the patriotism of the Canadian who is interested in the best development of the natural resources of the Dominion. It suggests that the planting of eucalyptus would be feasible in the western Canadian provinces.

It is a generally known and accepted fact that those species of eucalyptus which are hardy enough to withstand irregularities of climate and any frost whatever are the species which do not count for very much as far as rate of growth and quality of wood are concerned. Those species which are peculiarly favored in these particulars demand an excellent soil and a very favorable climatic environment. Therefore on the face of it this appeal to the Canadian is based on false premises in that in order to grow the wood at all in Canada the worthless species would be used and hence the plantations would be a failure. The promoting companies might succeed, of course, in gathering up a considerable quantity of capital because of the success of other species in California climates; but the investor would stand to lose anything he put into such an investment.

Canadian investors can very well look very carefully into the actual facts pertaining to the industry and its so-called commercial development in the United States before seriously considering the suggestions set forth in the article entitled "Timber Farming and the Eucalyptus Trade."

Cultivating the Consumers

N A LARGE CITY of the Middle West, where hardwood interests are large, and where consuming interests are also considerable, it is a matter of common knowledge that the factory people buy a large part, if not most of their lumber, from outside. In other words, while the local yards are in a position to supply the wants of the industries in their own community, a large part of their business, which should logically be taken care of at home, goes to dealers in other communities.

The members of the lumber business in that market have an association which meets monthly for the discussion of matters of interest. At a recent gathering it was suggested that a special meeting be held at which the heads and lumber buyers of the consuming factories be invited as the guests of the lumbermen. It was felt that a frank discussion of conditions, on both sides of the fence, would result in the development of a better feeling and a more thorough understanding, and that much business which had gone outside might be retained.

It was finally decided, however, not to extend the invitation, many of the members of the lumber organization appearing to feel that the consumer should not be taken into the confidence of the lumbermen. It was feared that the buyer of lumber might possibly learn something to his advantage, or rather, something to the disadvantage of the seller.

Is it possible that any considerable portion of the lumber tradeis getting its business under conditions which do not admit of meeting consumers on a fair and square basis?

Red Gum For Interior Finish

Few woods illustrate more pointedly than test guin the value of a thorough knowledge of the ways of bandlog them. This wood has been carefully studied by mainstact cress because of the beauty of its grain and color and of its many good properties. The tact that its likable qualities are intimately associated with some which are not so desirable, increases interest in this material, because it has been found practicable to eliminate the objectionable features and accentuate those which are pleasing. To do this, however, requires knowledge in the art of bandlog

As is well known, it was not many years ago that red gum was unwelcome in any woodworking establishment in the country because nobody wanted to handle it. It was looked upon as too

difficult to season, and too troublesome after seasoning. The beauty of the wood was well known, but there was such strong prejudice against it that a long time clapsed before anyone would consent to give it a fair trial.

The cime came, however, when red gum forced its way into popular esteem. It won on its merits in spite of the handicap of prejudice. The fact is, the way was shown by users of this wood on the other side of the sea, who were more patient than the Americans, if not quicker to recognize the merits of the wood. Red goon was used in England, France, and Italy, by the best manufacturers, long before it had any standing in the land that produced it.

The hardest problem to be mastered in this country was the seasoning. That trouble was finally overcome, and the results fully justified the effort. Many leading manufacturers now handle the wood, and some specialize on it, using it in their finest and most exacting work. It was formerly employed under names other than its own. It was passed as Circassian walnut. and it could be finished to imitate that wood so successfully that many a purchaser never could be made to believe that the wood was red gum.

The policy of calling it by some other name is now passing away. It stands on its own merits and under its own name. Fine buildings are being finished with it, in wainscoting, columns, beams and panels.

The accompanying picture of an interior view of the residence of J. B. Utley, Evanston, Ill., affords an idea of what is being done with red gum. The milling was done by the Chicago Sash, Door and Blind Company, 1255 North avenue, Chicago.

No wood could stay in its place or hold its shape better. There are various combinations, as an examination of the picture shows. There are panels, molding, and frames. Some of it is solid gum, an inch or more in thickness, some is thinner, yet solid, while some is veneer glued upon cores of other woods. All stands alike, all perfect, without a defect anywhere visible. No wood could present a more handsome appearance.

E. W. Dietsser, who the supervision of the militing of the gunshown in the picture, has made a study of the seasoning and working of red gum, and he has arrived at very definite conclusions as to what the wood is capable of. When it is desired to build up solid pieces, using inch lumber, it is preferred that the stock be quarter sawed. This is not done for the purpose of increasing the beauty of the figure, though incidentally that result is often secured. The principal object is to obtain wood which will season straight and remain straight after it is seasoned. Experience indicates that this is more and to occur with quarter sawed stock than with the other; but it by no means proves that ordinary lumber may not also be finished and seasoned in the same

way with equal safety.

The seasoning is not done by any secret process, but it must be done with judgment and care if the best results are sought. Air-seasoning and kiln-drying are employed; and an increasing quantity of the wood is subjected to steam under pressure before passing through the kilns.

It is well known that the red gum tree produces both sap lumber and heart wood. Some call the former "saps" and the latter "red gum," though both are cut from the same tree. Mr. Dierssen's experience has been that when he uses inch lumber for interior finish most satisfactory results follow the use of heart wood only. It is not claimed that sap may not be equally satisfactory under certain circumstances; but it is believed to be less dependable in seasoning.

When veneered panels are used adjacent to solid quartersawed work, it is customary to use quartered veneer also, in order that there may be uniformity in appearance. Such veneer is made by the slicing process and it is cut from the bark to the heart. It may be cut very thin, because the wood is sufficiently tough to hold itself together.

When solid red gum is to be worked into cabinets and finish the most careful inspection occurs before the work begins, because it is absolutely necessary that material be in proper condition before any cutting and fitting are done. If this matter is properly attended to there is no danger that the finished work will warp, twist, or pull apart. Unsatisfactory results in gum employed as interior finish nearly always are due to the fact that the wood was worked up before it was properly seasoned. This, of course, holds when the right kind of stock has been selected, as well as in wrong selections. Everything must be right to begin with.

The accompanying picture shows gum joinery in close proximity to the fireplace. That is a position which will try the standing qualities of any wood. The heat and dryness are excessive, and if joints do not pull apart there and panels warp or blister, they will not do so anywhere.

UNDER A SEVERE TEST

Wood Manufactures in the U.S.

The government was just profished what are practically complete ligues on the amount of wood maintractured into commercial commodities vearly in the United States. This is not the lumber output, but the articles maintractured of wood, such as farmitine, boxes, agricultural implements, handles, vehicles, steam and electric cars, musical instruments, doors, ships and hoats, and many more. It does not include rough hird er which is used in the form it is in when it comes from the saw; nor does it include crossties or wood pulp. It is, in fact, the output of shops and factories.

The output of rough lumber has been published annually for many verse; but there has been a want of information concerning what becomes of the lumber which is not used in the rough. Nobody know how much there was of it, or how much was worked into you ous commodities. There were various guesses as to how much of the country's lum er was used at the rough and how much was further manufactured before it reached its final use. Some such guesses were not far out of the way, while others were wild.

The Forest Service began a systematic investigation recently. Its plan covered the whole country, but the work was undertaken state at a time, usually in cooperation with the state or with some association or corporation in the state. Most of these reports were published from time to time as completed. The first was Massachusetts, and others followed rapidly until twenty-nine in all have now been published. This leaves nineteen unpublished, but it is understood that some of these will shortly appear. However, since the government only collects and tabulates the material and depends on each state to publish its own report, there is some uncertainty as to when the others will appear.

In view of this, the Forest Service has published a synopsis covering the whole country. It is not a complete report, nor does it go into details, but it gives the amount of wood manufactured into finished commodities yearly in each of forty states. Those omitted are practically non-manufacturers of wooden products—North Dakota, Nebraska, Wyoming, Utah, Colorado, New Mexico, Arizona and Nevada—so that the report as to totals is now practically complete. It is appended to the Ohio report, which is the latest to come from the press.

The following table, rearranged from the form in which it appeared in the Ohio report, gives in concise figures the amount of wood passing yearly through shops and factories in the forty states. For convenience, the output of lumber in the states, in 1910, is also given.

ANNIAL MANUFACTURES OF WOOD BY STATES

ANNUAL MANUFAC	TURES OF WOOD BY	STATES	
	Quantity	Lumber	Number

South Dakota	6,000,000	16,000,000	8

Could such reports as this have been made available, say every ten years, since the government was founded, they would have provided one of the most valuable features of our industrial history. Doubt-less they would exhibit many interesting and remarkable sidelights on the country's development.

Unfortunately, such statistics were never collected in the past. The present report is the first. It marks the beginning of the exhaustive reports on timber and its utilization. Doubtless reports of a similar kind will be published at frequent periods in the future, all dating back to the present one as a basis for comparison.

The figures show that sixty per cent of the annual output of rough lumber finds its way to shops and factories to be further manufactured. Few people have guessed that the ratio is so high. Some well informed men have placed it as low as twenty-five or thirty per cent. This is proof of the need of reliable information on the subject. It is probable that the ratio will increase in the future, as utilization becomes more close; however, to make such a prediction would simply be another guess, and it might miss the mark widely.

There are some items in the table which are liable to mislead if not explained. Arkansas and Louisana are credited with the remanufacture of more than a billion feet each. It is well known that manufactures of wood are not much diversified or highly developed in those states. They are producers of lumber. However, matched and planed flooring and dressed siding are counted as manufactures, and these make up the bulk of what the table shows in several of the southern yellow pine states. These commodities are dressed to save freight in long shipments north and east to their markets; and to that extent the southern states are manufacturers to the full amounts shown in the table.

Twelve states send to their shops and factories more lumber than their sawmills produce. That should not be a matter of surprise. Naturally, thickly populated regions, with little timber of their own, will give more attention to manufacturing than is given by the inhabitants of a sparsely settled region. They import wood to supply their factories. The average haul of all lumber sawed in the United States is about 300 miles. This movement is solely for the purpose of taking it from places where it is not much in demand to places where it is needed; and the best markets are usually found at the factories, though they may be far from the mills which saw the lumber.

The number of wood-using industries in a state is an index to the closeness and diversity of utilization. Remarkable differences occur, as are shown in the accompanying table. Illinois has fifty-two such industries. Mississippi only twelve; yet the latter state produces sixteen times as much lumber as the former. It is not, therefore, so much the abundance of native timber in a region as a demand for

manufactured acticles that determines the extent of wood using an dustries. Idaho and South Dakota have eight such industries each The state of Washington, which produces more lumber than any other, has nineteen industries; Louisiana, which is second in produc tion, has only twilve. Perhaps Perusylvania is the most evenly

balanced state a respection of reign number in line maintactored articles. It has forty two accistness and leads all the other states, in the extent of its good more to takes, and it likewise stands night in output of rough lumber. The standing timber, the factories and the

Consignments Demoralizing Abroad

\$250,644

Holding back with foreign shipments is still in order, as is indieated by the report of exports for the month of January, compared with the corresponding month of 1913. The difference is no longer as great as it has been, but the tendency to curtail forwardings is none the less unmistakable, and would be even more so if allow ance were made for the shingle shipment of West Virginia spruce sent out last month to South America, which added some \$30,000 to the total for the month, and yet cannot be regarded as really a part of the exhibit for the reason that such shipments are only occasional, The difference between the two months, as can be readily seen from the figures, is almost entirely in oak, both log and lumber shipments having fallen off. Thus, there were no shipments of oak logs at all last month, against 45,000 feet in January, 1913, while the forward ings of oak lumber were 1,618,000 feet, worth \$54,149, against 3,573,000 feet, valued at \$122,043, in January, 1913. These two items alone account for the difference. As to the rest, there are shiftings, to be sure, but a deficiency in one is off set by an excess in another, so that they about balance. Poplar exports even increased, and it is with regard to poplar as one of the woods that exporters issue warnings against shipping on consignments, as such shipments are almost certain to not losses. The exports reflect fairly well the state of the foreign markets and should serve as a guide to shippers. The figures are as follows:

	19	1.1	19	1.3
	Quantity.		Quantity.	
Logs	feet	Value	feet	Value.
Hickory	24,000	8 946	169,000	8 5,641

Totals8190,790 Shipping lumber on consignment to some of the foreign markets has again become an acute problem, and prominent shippers are issuing warnings against the practice as productive of serious losses if persisted in. The markets especially to be guarded against are those of the United Kingdom, Rotterdam and some others on the Conti nent, which have become so congested with stocks, chiefly oak and poplar boards and oak planks, that the exporters who ship on con Signment only have a hard time of it in the face of the active com petition and the low prices that prevail, while the consignment shipments are kicked about like a football, to be finally sold for whatever they will bring, which is often considerably below their actual cost to put down on the other side. The steamship companies, perhaps unintentionally, encourage the unsettlement, on account of consignment shipping, by exposing their manifests to whomever will inspect them. It thus often happens that a foreign buyer receiving

a shipment of contract langua, for variety he cands to pay a certain litteen or twenty cuts or eye more of consignment staff, which, having no contract guarantee behind it, is thrown upon the market and goes for what it will bring, whether the market is in shape to take it or not. The contract consignce immediately becomes dissatisfied, as is quite natural, and begins to find fault with the shipment, which may have come up to requirements in every respect, with the idea of getting the price he must pay down to the cost of the consignment lumber, with the result that the exporter is put to more or less trouble and the entire market is unsettled. The listory of the export trade is one long record of disasters, due almost entirely to consignment shipping. Sooner or later every one of the exporters who engage in the practice indiscriminately is overtaken by misfortune. It requires a careful study of the foreign markets and close regard for their requirements to steer a safe course, and the fact cannot be too strongly insisted upon that the present is a time when it behooves the exporters to go slow about forwarding stocks. The chief incentive, naturally, is that of being able to draw on consignment shipments for seventy-five per cent or more of the value of a shipment the moment the invoice is at hand. The foreign broker gets his commission on this seventy-five per cent or so, and frequently does not bother greatly about realizing the difference between it and what would be a fair market price. In fact, his share in the difference is so small that he cannot well afford to spend a day or more finding a taker who will pay the full price. The consignment, therefore, is often sacrificed, and quickly turned over, realizing perhaps \$5 or so per 1,000 feet less than it should bring. This \$5 is generally the difference between a profit and a loss. If the bad effects of consignment shipping were confined to the men who engage therein, they might be quietly left to become the victims of their own rashness, but, as pointed out, the evil is far-reaching and affects the entire trade. The situation in the markets mentioned is reported to be worse at present than it has been for some time, and consignment shipping will only add to the confusion.

Unavailable Assets

The state of New York's ownership of forest lands affords an unique example of unavailable assets. It possesses several hundred thousand acres of timber, yet it cannot touch a stick of it. The state constitution forbids. Not a tree must be cut, even though it is overmature, or even though it becomes a menace by dying. It may be infested with enough beetles to stock the surrounding timber, yet the law will not permit its removal. Advocates of forestry in the state recommend the purchase of more land and the planting of more trees. while timber already over-ripe is permitted to die and rot. The state owns one-fifth of the forest land within its borders and onefourth of the standing timber. Its stumpage is estimated at 6,000,000-000 feet; yet this is left untouched while factories in the state send outside \$20,000,000 a year to buy lumber. The annual demand for crossties is 16,000,000 and more than half of them are bought beyond the borders of New York. It is estimated that the growth of the state-owned forests amounts to 525,000,000 feet of lumber a year; but it grows to die unused unless the people of the Empire state get busy and change their constitution in a way to permit lumbering operations on state lands. The proposed change in the constitution has been advocated for ten or fifteen years, but it is apparently as far from consummation as ever.

Lumber Sales Conditions Changing

The general manager of one of the largest concerns in the lumber business recently completed a long trip to most of the leading markets in the North and East. His trip was not primarily for the purpose of selling lumber, but rather to enable him to feel out conditions affecting consuming industries, and to get a line on the probable business to be handled during 1914. Incidentally, it may be added that his trip has made him an optimist of the reason-why type. But the most important result of his investigation, as summarized in his own words, was as follows:

"We have been familiar with a tendency on the part of a good many consumers, during the past few years, to buy closer to their current needs than previously. A few years ago the consumer was accustomed to carry immense stocks of lumber on his yard; but while he has been reducing his stocks gradually for some time, it is only now, in my opinion, that the plan has been generally used, and has been carried to the point where the lumberman is expected to deliver material on a sufficiently exact schedule to enable the consumer to unload lumber from the car into the kiln, making a continuous movement through the factory and into a car at the other end as the finished product."

The fact that this tendency has been gradually developing, especially since the panic of 1907, has been commented upon many times; but it may be worth while to consider some of its effects on the business, especially as regards the selling department.

One of the things which undoubtedly will come about will be that contract business will be more important, both as to volume and as to the number of concerns using this system. Heretofore the bulk of the trade has been carlot orders. The consumer has picked up a car here and a car there, both according to his requirements and according to the opportunity to get a special value. In other words, he has been inclined to shop, and to buy in excess of present needs, in order to pick up a bunch of lumber that looked like a particularly good value.

Under the new regime, assuming that the consumer has really decided to eliminate carrying stocks as far as it is physically possible to do so, the vital thing will be to have the lumber coming forward all the time in just about the right quantities to keep the kilns loaded up and the factory supplied. This being the case, the value of having a permanent connection, which has definite shipping orders and is in a position to carry them out, will be emphasized, and the consumer will need to be assured that his material is coming forward just as he requires it.

This will give added value to the stability and reliability of a lumber concern, and a buying connection, from this angle, will be just as much worth while as a selling connection, from the lumberman's standpoint.

A close analogy may be developed to the methods used in the iron and steel business. With the exception of pig iron, which is usually bought for immediate delivery, the consumer of iron or steel usually contracts for his season's requirements, and then merely specifies against his contract. This is a good deal simpler for the consumer, and certainly easier for the seller of the goods. since one sale closes up the business for the entire year.

The disadvantages of contract business have been referred to a good many times, but it must be conceded, in the last analysis, that the proposition depends largely on the character of the people at each end of the contract. If the buyer is the right sort, and the seller makes his agreements to keep them, not to break them, contract business is the best kind one may book. It is only when the consumer or the seller is the sort likely to be influenced in carrying out his contract by the conditions of the market, that a contractual relationship becomes undesirable. And, of course, it goes without saying that no business house which aspires to standing would decline to carry out a contract for the sale or purchase of lumber, made in good faith by both parties.

Such things are largely a matter of trade custom, of course.

One may venture the assertion that in the steel business the house which attempted to wriggle out of a contract for sheets, in order to take advantage of a temporary decline in the market, might have difficulty getting material later on, not because of any general agreement, but because it would be recognized that that type of buyer is undesirable from the standpoint of the manufacturer of the material.

"Contract business has always been the most desirable kind we have had on our books," said a hardwood man who has grown gray in the business. "We make contracts only with houses which we think will keep their part of the agreement, and we try to live up to the spirit as well as the letter of our end of the matter. The elimination of selling expense, to a large extent; the knowledge that the production of the mill is sold ahead for some time to come, and the ease with which bookkeeping accounts with a comparatively limited number of large buyers can be handled, all argue for contracts, when properly made."

Contracts, as a matter of fact, should specify a maximum and a minimum amount. One of the loop-holes used by the unscrupulous buyer, often, is that afforded by a contract covering merely "requirements," instead of a stated amount. But with a definite agreement limiting the amount of lumber to be delivered on the contract, both as to the smallest and greatest amount to be delivered at the contract price, both sides are protected, and the loop-hole is plugged up tight.

It is often said that the buyer usually insists on having a contract for a season's supply made at the price prevailing at the time the contract is signed. This is not always the case, however. Quoting the lumberman referred to at the opening of this article, "The buyer who studies the situation knows that today, for instance, plain oak is selling below the price it will be sold at six months from now. He would not ask you to sell him enough for an entire year's consumption at the current price, but would willingly agree, for the sake of being protected against possible advances of moment, to pay an increase covering the lumber to be delivered throughout the year."

A big advantage growing out of the new system of buying lumber, according to those who have studied the situation, is that the lumberman will of necessity have his finger on the pulse of conditions in consuming industries more frequently than under the old system or even during the period of transition which has been on for several years. When the consumer has a year's supply or more on his yard, his purchases were not indicative of the way things were going with his trade. This put the lumberman at a disadvantage, to the extent that he could not prepare for the future with the intelligent understanding which the manufacturer in every line should be able to supply.

If the consumer buys for immediate use, however, his purchases, or his specifications against his contract, will give a constant and dependable index of the state of the trade in that particular industry, and the lumberman could guide his own operations accordingly. He would, in fact, be closer to the market, a condition which has always been devoutly wished by the lumberman, who has bemoaned the fact that the period involved in bringing material from the stump to the factory is excessively long.

"I am convinced," said a big manufacturer, "that business under the new conditions will be much more satisfactory. Business will be more worth while, and can be taken care of to better advantage all around. Competition can be opposed more successfully, since service to one's customers and ability to deliver the goods at all times and under all conditions will be more important, in the eyes of the lumber buyer, than price, which is the all-important matter now."

The advantage of having modern drying equipment, which will enable the sawmill man to cut down the time that lumber will have to remain on his yard, will be emphasized under the conditions referred to, since the sawmill operator can see the changes in his market and take advantage of them without having to be a seer, as at present, when he is from three to six months away from the consumer, in point of delivery possibilities.

The furniture man is determined to "let the lumberman carry the stocks." The lumberman has been carrying them all along.

and will continue to do so. The actual consumption will remain the same, and it will cost no more to deliver steadily on contract than to pile up a lot of lumber in a consumer's yard and wait for it to be used before making another delivery. It will merely save the consumer a lot of expense and trouble, and will not be disadvantageous to the lumberman in any appreciable degree.

A Question in Veneer Trimming

One of the questions of the day which is just beginning to push itself forward noticeably is that of veneer trimming—when and how often veneer should be trimmed between the time of cutting and its final use.

Usually the veneer user passes this question by on the theory that it is no concern of his when or how often veneer is trimmed just so he gets the material in shape and size to suit his need at the time of using. It does interest the veneer user, however, as well as the veneer maker, mainly because it is a question of utility or efficiency in utilizing timber, but also partly because there is involved a matter of getting the veneer to be used in exactly the shape that he wants it.

. To understand this matter of trimming veneer, what it means and all its aspects and the when, why and how of it, we must go back to the time and place of its production and then follow it through to the finishing room.

Usually when rotary veneer is being made there is a part of the end of the block that is trimmed off in the process of cutting. being separated from the main sheet by what are termed score knives. This gives a veneer product which consists of a straight sheet or ribbon of veneer uniform in width or length and with the ends trimmed exactly square with the cutting and parallel with each other. It naturally makes a more presentable sheet of veneer than if the score knives were not used and the entire face of the block were peeled off because then there would be some irregularity in the width of the ribbon or the length of the veneer, and this is objectionable in a way.

Usually when the veneer is peeled out in this way it is cut up into dimensions of some kind. One may make it a business to cut to a size that will allow for shrinkage in drying and the final trimming to the exact dimensions required. Another may clip his veneer out in long sheets, as long as can be handled, and dry these sheets before clipping to dimensions.

In following this process the first noticeable feature about it is the waste incident to the end trimming by the score knives. This waste varies from one inch at each end to as high as three and four inches, sometimes, and in the course of a day's run it counts up considerably. If the logs are brought into the veneer mill in long lengths and are freshly cut with a drag saw before working, it is practicable, by careful attention, to reduce this end waste to a minimum of approximately one inch to each end. Where the logs are cut to short lengths in the woods, however, there is some checking in the ends and for this reason a more liberal allowance is made for end waste, the allowance being approximately three inches for each end.

One might well argue that it is immaterial whether this extra end length is trimmed off and thrown in the waste pile at the veneer machine or afterward. Indeed, one might urge that the sooner it was trimmed off and disposed of the better because it saves the handling of the waste through the driers and the trimmers and so on; but another factor enters there, which concerns the veneer user as well as the veneer manufacturer. It is the factor of shrinkage.

Veneer does most of its shrinking, though not all of it, sidewise. This is well known and understood. But the side shrinkage is not always uniform. There is some end shrinkage and there is also enough irregularity in the side shrinkage to draw the ends out of square and make another trimming necessary to straighten them out.

There have probably been wrangles galore over this matter of end shrinkage in veneer, mainly because we are too much in the habit of taking the attitude that end shrinkage is small, insignificant, and therefore needs but little attention. It is a known fact that where men are cutting drawer bottoms or other single ply stock to fit into grooved spaces neatly and cutting to exact dimensions with score knives at the veneer machine, it often turns out that the stock fails to fit. It will be short in length, it will be found so out of square that the sides and ends will not fit up at the same time. Then will come the charges from the user that the veneer manufacturer did not cut to specifications, and the veneer manufacturer will accuse his veneer cutter of carelessness in following instructions as to length.

The only way to get exact dimensions in veneer is to make those dimensions after the veneer is thoroughly dry. Cutting to specific dimension in either length or width before drying will result in disappointment if the requirements are very exacting. To give satisfaction where the requirements are exacting as to dimensions, the trimming to size must be done after the veneer is thoroughly dry, and generally it is best to do it with saws. Some thin veneer is cut both crosswise and lengthwise with knives but to get the best results in trimming veneer to size the ideal way, either with thin veneer or thick, take it in bulk and trim it with saws.

This being true, the question naturally rises as to whether veneer should be trimmed twice or only once, whether it should be cut to length with score knives and made long enough for a retrimming, or whether the score knives should be abolished and one trimming made to do it all.

The answer to the question depends somewhat on circumstances. Some trimming is quite often essential before drying. This is true especially of side trimming. Sheets of veneer must be cut to some sort of dimensions so that they can be handled, and in cutting to these dimensions notice must be taken of the final size requirements and allowance made for shrinkage in drying and for the final trimming to size. It requires the exercise of some care in making this allowance to prevent unnecessary waste on the one hand and to prevent an unusual amount of culls through lack of width on the other hand.

The usual allowance for shrinkage in width is ten per cent—one inch for every ten. Some woods, notably maple, will not shrink this much, but gum will come very near it. The shrinkage allowance would be the same whether the veneer sheet is cut up into individual sizes or into sheets of two or three sizes. If the final dimensions are small, however, a saving in trimming allowance may be effected by handling the sheets in multiples of the final size.

In the end shrinkage and allowance for trimming we might argue that since there must be a final trimming after drying, the score knives should be taken off and let the full length of the block go into the sheet with all its variations in alignment with the sheet. This argument is good, too, where the veneer is being dried, shipped and handled single ply. It involves only the drying and shipping of that extra length, and in return the extra length insures better stock after the final trimming and more room to do the trimming.

If the veneer is to be worked up into panels or built up lumber, however, there is the factor of glue, which cuts some figure. The economy in glue is just as unportant as economy in veneer, consequently the gluing up of two or three inches of extra length of veneer on each sheet and then finally trimming it off and throwing it away means the waste of quite a lot of glue, which is objectionable.

The ideal plan here would seem to be that of using the score knives to reduce the sheets to something near the end length desired and to climinate the burden of the waste, while at the same time leaving enough length for the final trimming to exact size.

If the right kind of efficiency and utility were practiced at the veneer cutting and logs brought in in full length and carefully squared to length and as carefully handled in the machines. it should be possible to so reduce the allowance for end waste that it would not be necessary to use score knives and no trimming need be done on the veneer until after the final drying, other than that of chopping it up into sheets of a size that can be handled

There is today a pretty strong disposition to abolish as far as practicable the trimming of green stock to exact dimensions with score knives and clipper and to run out the full sheets, dry them and then trim to exact dimensions. Where the veneer user is buying his stock in plain sheets that are to be trimmed to exact dimension before using he is perhaps better off in buying stock that has not been cut to length with score knives for it will give him room for trimming, and enable him to get a degree of precision in length that is not possible in trimming green stuff with score knives.

* Timber Trade in West of Scotland

Expectations started high that the timber trade of Glasgow and the west of Scotland during 1913 would enjoy a prosperous year, in view of the fact that the principal local wood consumers were actively employed, but these expectations have scarcely materialized. Throughout 1913 at no period was there any pronounced activity in the demand, while occasionally an exceptional dullness prevailed, and par ticularly so during the latter half of the year. For what share of prosperity the trade did enjoy, it must look to the shipbuilding industry. From this source a steady demand has existed, while from other outlets the demand was exceedingly disappointing. The demand for housebuilding requirements has been in poor shape all the time. Wagon building has been moderately employed, but recently has shown a tendency to slacken. Quite a quantity of oak has been consumed by wagon builders, although compared with last year the figures are considerably less. Motor manufacturers have accounted for a steady demand for mahogany, oak, poplar and gum. Packingcase makers have been fairly well occupied, although hampered at times, owing to the price of stocks. The various cargo lots coming in have sold well, and buyers of spruce and Riga whitewood have adopted the policy of purchasing only against immediate requirements. Furniture makers have had a busy year, and a steady demand has been kept up for oak, mahogany, poplar, walnut and birch. Gaboon mahogany logs have again been an important feature of the imports, although the price continues to rise. The price of Honduras mahogany also continues to rise, and of course this is only to be expected because with demand all over the world increasing and supplies none too plentiful, the possibility of prices rising still further must be reckoned with. Spruce and American oak advanced during the year, but they can hardly go any higher this year. Instances of prominent staples decreasing in price during the year were waney pine logs, Canadian, Siberian and Californian first quality pine deals and sidings, sawn pitch pine, and Californian redwood. In the case of Canadian pine, it is more and more going out of use, owing to the substitution of cheaper goods. In the other cases, the freight reduction, and also the import exceeding the demand, has had to deal largely with the drop in prices. No appreciable change is to be recorded in the case of elm and oak logs, birch, Oregon pine, greenheart, hickory, ash, maple and walnut. A regrettable feature which, year after year, becomes more prominent, is the gradual decay of trade with Canada, at one time the largest exporter of timber of all the countries of the world to the United Kingdom, now a mere shadow of what it once was. It can be a matter of only a few years when supplies from this source need no longer be seriously reckoned with, unless something in the form of Colonial preference in the shape of a tariff on imports from competitive countries be imposed.

During the first part of the year freights continued at a high level until August, at which time it was the general opinion that shipping was in for another good autumn, but these anticipations did not materialize, and in September the demand for tonnage was not nearly

so persistent as the previous autumn, and freights began to fall away rapidly until in November when top rates should have been reached, there occurred something like a collapse. The lateness of the cotton crop had much to do with this, as excessive tonnage had been rushed out in order to secure this business. The depression of the freight market has become more acute since the beginning of the year, and shipowners are finding it extremely difficult to secure profitable employment for their steamers. The world's trade has undoubtedly declined more rapidly than was considered probable not many months ago, and the supply of tonnage which has been largely increased in recent years, partly owing to the replacement of old vessels by steamers of considerably greater carrying capacity, is now much in excess of the demand. The present depression is felt all the more by shipowners, owing to the fact that running costs have rises substantially within recent years, and that the tendency is still upwards.

SHIPBUILDING

This great industry, which looks to the Clyde, not only as its birthplace, but as the principal centre of its activity, has had a remarkably successful year. There was never any doubt as to the genuine nature of the demands for new tonnage, or as the ability of the shipbuilding and marine engineering firms to supply that demand, and it was not until there came a falling off in the freight market that owners and builders became less active in their negotiations regarding orders for new ships. With that falling, a reduction in the volume of work on hand in the yards was anticipated, but sufficient time has not yet passed to allow freights to affect seriously the activity of many firms engaged in turning out new ships.

The returns are as follows:

1913.	Vessels.	Tonnage.
United Kingdom	. 1,474	2,263,933
Of which the Clyde contributes	370	756,976
And compared with 1912	. 389	640,529

As has been the case for several years past, the market has had entire immunity from serious financial trouble, which may be considered cause for congratulations, in view of the dull conditions existing. The trade has had its share in the matter of labor trouble, the most serious one being the prolonged strike of carters, which prevented deliveries over a period of six weeks, and to some extent accounted for the reduced consumption of timber compared with previous years. In comparison with 1912, the imports and consumption are considerably down, and stocks have accumulated in certain directions out of proportion to the demand, and this will have the effect of lowering prices, unless there is a cessation of supplies for a time.

Indications for the present year are hardly so favorable as they were a year ago, yet it is difficult to conceive that the dull conditions which have so long prevailed can become worse, unless there be a serious falling off in shipbuilding requirements, which—as already indicated—has been the mainstay of the market.

An Unusual Logging Operation

In the Blackwater Canyon in the heart of the hardwood belt of West Virginia the Baheoek Lumber & Boom Company is success fully accomplishing a logging operation which is one of the roughest east of the Rocky Mountains. The Blackwater Canyon is typical of large tracts of mountain lands which carry valuable stands of timber which have defied the lumberman for generations because of their roughness, making logging unprofitable, if not quite impossible, by horse or steam ground-haul methods.

Many lumbermer know the Blackwater Canyon. The Western Maryland railroad passes through it on the Douglass side where the hills are much less broken and much less rough than on the Black water side. On the Douglass side today there is a scene of desolation. The gradually sloping hills were stripped of their timber by old horse methods.

In the canyon itself stands some of the most magnificent timber in West Virginia, and there it has stood for years awaiting an ecofeature of any cal lew cycle dder was found by Mr. Viering as essential for success. The greatest meet for a stackpuller developed when his cable was stretched aphill for downhill pulling. With a long span the weight of the pulling line become so great that it was impossible for the crew to pull the stack.

Another difficulty presented itself, for in conveying logs, especially downhill, it was essential to apply the brake to the outhaul drum, allowing it to slip in order to retain the log in the air. His brakes would burn out as fast as he could make them. Just when Mr. Viering was experiencing his greatest difficulties, he became convinced that his difficulties could be eliminated by the employment of the Lidgewood interlocking skidder and slackpuller. These represented the difference between success and tailure. Without them the cost of logging was prohibitive. With them the cost of logging was prohibitive, became exceedingly profitable.

The first of the new caldeway skidders arrived in the fall of 1911

TRYING OUT THE CABLEWAY SKIDDER UNDER UNUSUAL CIRCUMSTANCES, BLACK WATER CANYON, WEST VA.; A 2600 FOOT SPAN

nomical apparatus for logging by power. While the Babcock Lumber & Boom Company's men were logging the Douglass side they were studying how it would be possible to log the canyon. Its lands extend for something like twelve miles along the Blackwater river, the timber slopes on each side being from one and one-fourth to four miles wide. The logging of this canyon is one of the most remarkable logging engineering propositions in America, if not the world. It is in charge of Fred W. Viering.

Mr. Viering began his experiments with some second-hand steam skidding outfits. One was the old type cableway skidder similar to that which was first introduced in the cypress swamps of Louisiana. He tried ground hauling methods and found them wholly impracticable. In fact, this second hand cableway skidder failed in essential particulars. Nevertheless, his experiments showed that if the problem were ever to be solved at all it would be solved with cableways.

In building a railroad from Davis to the Blackwater side he encountered a single point that cost \$6,000 to blast and one mile that cost \$15,000 to grade. As Mr. Viering found that railroad building was going to be so extraordinarily expensive he concluded that it was absolutely essential to reach out long distances with his cableway. As the spans increased so also did his trouble, in direct proportion to their length. The slackpuller, while recognized as an important

just after Mr. Viering got his stretch of switch-back road built on the upper slopes of the canyon and the skidder was set to work there. It was a success from the start and since then two more similar skidders have been purchased and set to work, one in 1912 and one in 1913.

Mr. Viering said recently: "I now have my three new skidders running so that they practically can be depended upon to log my mill cutting 125,000 feet per day."

While a long span cableway needs interlocking drums and slack-pullers there is another element of equal importance, namely, a high head spar. It was not practicable to rig the skidder to standing trees for they seldom were found growing where wanted. A portable spar, and a tall one at that, was absolutely essential for long span operations. Mr. Viering has stretched his cable to distances up to 2,600 feet and has constructed portable spars seventy-five feet high.

The general manner of operation consists in setting up the skidder and its seventy-five-foot spar in central positions and skidding radially from it in all directions covering a complete circle. The spar is carried on a separate mar from the skidder and is mounted on a roller bearing turn-table so that the rigging can be faced in any direction. After a complete circle has been logged and the skidder is ready to be moved, the spar is swung down, and because of its great length the

apper part of it is supported on a flat car. This spar is built of spruce, 28 inches at the butt and 17 inches at the top. The ingenious manner in which Mr. Viering has designed and constructed this spar has been recognized by the government of the United States who granted him a patent for his improvements. From each setting, the cable reaches out uphill, downhill, across draws and gulleys, and brings its load singly or in bundles with absolute independence of ground conditions. The aerial line is a straight line and there is nothing to interfere with high speed in bringing in the loads. As said before, the spans have reached out practically half a mile. In a single setting a circle nearly a mile in diameter has been completely logged.

The total number of feet skidded in the five months covered by a special report was 4,060,251; the total number of logs handled was 24,330, and the total labor cost for skidding was 96½ cents per thousand feet. Every log was taken to the railroad by the skidder from where it was felled and no horses were employed in bunching

or yarding the logs. In one day a skidder put in 96,000 feet of logs, which is a record breaker for the mountainous country. The logs are small, and it takes twelve hardwood logs, eleven spruce, or five hemlock logs to the thousand feet.

A single week's work (6 days) from July 25 to July 31, showed a daily average of 46,530 feet skidded with a labor cost for skidding of only 71% cents per thousand.

The mountains are all broken and filled with cliffs and knolls, and the ground is so bad that there are places where the loggers have to but the trees off of cliffs with dynamite, because it is impossible to get at them to cut them down.

A trip of 2,400 feet can be made in 8½ minutes, with a load of from 1,800 to 2,500 feet, all due to the slackpuller and our signal bell system. This takes only six men against the old way with twelve men. They go right to the stump for the logs, and not to a pile where they had been put with horses. In this work a skidder without slackpuller and interlocking device would not suffice.

Wood-Using Industries of Ohio

A bulletin containing 133-pages, embracing a report of the woodusing industries of Ohio and a list of manufactures, has just been published by the Ohio Agricultural Experiment Station at Wooster. The report was compiled by Carroll W. Dunning of the Forest Service.

Sixty woods are used by factories in the state, thirty-nine of them hardwoods and tweaty-one soft woods. Only four of the soft woods are produced by the forests of the state, while most of the hardwoods grow in Ohio. It is probably the most typical hardwood state in the whole country. It has always been such, and though highly developed now along agricultural lines, it still produces hundreds of millions of feet of hardwoods yearly. In 1911 the total output of its sawmills was 427,161,000 feet; of which the soft woods made up only 8,889,000 feet, and the hardwoods aggregated 418,272,000.

Wood-using factories in the state require more than twice as much lumber yearly as all the mills in the state cut. The consequence is that the shortage must be made good by imports from outside regions. The average cost per thousand feet of all woods manufactured in the state is given at \$30.47. That is for the rough material when it reaches the factory. In order to compare this with similar figures for certain other states, the following list is given:

	Average cost
	of wood.
Iowa	 \$30.92
New York	 30.76
Michigan	 23.12
Kentucky	 , 23.07
Maryland	 20.67
Arkansas	 11.49

The various kinds of woods used by factories in Ohio, together with the quantity and cost of each, are shown in the table which follows:

2020 1101	Average
	cost per
Kind of Wood. Feet b.m.	1,000 ft.
Yellow poplar	\$ 29.42
White pine	29.68

	onv		240.00
	sewood		350.00
	Total	915 272 369	\$30.47

Of this wood 165,174,792 feet grew in the state, and 750,097,577 came in from other regions. The total cost of the whole quantity was \$27,884,839. Eight are foreign woods: mahogany, Spanish cedar, Circassian walnut, padouk, English oak, teak, ebony and rosewood. The highest priced wood is English oak at \$410 per thousand, the cheapest, sweet magnolia, at \$12.

The utilization of wood in Ohio is highly developed and diversified. The smallest industry uses 555,000 feet a year and the largest 249, 000,000. Every industry, except matches and cigar boxes, employs

home-grown wood in part, but no industry is wholly supplied with material grown in the state. There are thirty-five industries in all, which are listed below with the quartity of wood demanded yearly by each:

Ohio Industries and Qu	ANTHY OF	Wood	USED BY	EACH

They were of kinds so various that they do not fall under any of the industries, but are grouped as miscellaneous. Some of the details

of this group follow:

Artificial limb manufacturers used only one wood-willow, and the entire supply was cut cutside the state. Umbrella racks made mostly of metal have wooden frames; ash and white oak supplied the material. Hard maple answered for looms of silk and textile mills, the sapwood of red gum for curtain poles and black walnut for gun stocks. The making of coffee mills required yellow poplar and red gum, and money drawers, yellow poplar and white oak, the former for the inside compartments, and the latter for the exterior. In the breweries to clarify and filter beer, chips cut from beech are frequently employed and are called brewers shavings. The manufacture of these in Ohio is not a large industry but is worthy of mention. On the other hand, the making of cigar molds, cigar makers' boards and presses is quite an extensive line of manufacturing in the quantity of wood reported. The molds are made of yellow poplar, basswood, maple and beech, while for presses and cigar boards, high grade bard maple alone supplied the demand. A large amount of wood in Ohio is converted annually into shoe lasts, trees and forms. The two former were practically all made from sugar maple and high grades were used; for the latter basswood and to a small extent yellow poplar met the demand. The only other product to be mentioned is farm gates made from red and white oak.

The woods used in largest amounts in the various industries are given below. The considerations determining the use of a wood are its suitability and availability. Many woods might suit a certain purpose well, yet not be in use because too scarce or too costly. The chief woods in each of the industries in Ohio follow:

Planing mill products, yellow poplar.

Boxes and crates, yellow poplar.

Sash, doors, blinds and general millwork, shortleaf pine.

Vehicles and vehicle parts, bickory Car construction, longleaf pine Furniture, white oak, Agricultural implements, shortical nine Handles of all kinds, white asn Marches, white pine. Store, bank and office fixtures, white oak Bungs for barrels and kegs, yellow poplar Dairymen's, poulterers' and apiarists' supplies whate pine Musical instruments, chestnut Tanks, vats and silos, longleaf pine Caskets, coffins and outer cases, white pine, Woodenware and novelties basswood Refrigerators and kitchen cabinets, red com-Chairs, white oak Machine construction, white oak Clear hoves and tobacco cases, tunelo Plumbers' woodwork white oak Trunks and valises, basswood. Laundry appliances, cypress. Ship and boat building, white oak, Moldings and picture frames, red gum. Brushes, beech, Pumps, veilow poplar. Playground equipment, white oak,

Payground equipment, white oak.
Patterns and flasks, white pine.
Pulleys and conveyors, yellow poplar.
Sporting goods, hickory.

Professional and sciential instruments, basswood Elevators, longleaf pine.

Saddles and harness, elm. Miscellaneous, yellow poplar.

White oak has more reported uses in Ohio than any other wood. It is made into 201 separate kinds of articles. Yellow poplar is second in number of uses, followed, in the order named, by sugar maple, red oak, birch and hickory.

More than 1,400 manufacturing establishments that make articles wholy or partly of wood, furnished reports from which the government report was compiled.

Logging Conditions Around Memphis

Weather conditions have been more favorable than usual throughout the Memphis territory for this time of the year for logging operations, and these have made very good progress. There has been some rain but the amount has been considerably below the average. In fact the entire winter has been exceptionally open and those who have had work to do in the woods have suffered little interference on this account. As a result the amount of timber prepared for later use at the mills here and elsewhere in the hardwood territory has been rather full. The great trouble, however, has been in securing facilities for the prompt handling of timber. The railroads have offered all the cars necessary and conditions in this respect are in striking contrast with the shortage of cars and lack of motive power noted in other seasons; but this is more than offset by the poor transportation facilities by water. The stage of both the Mississippi and its tributaries has been so low that comparatively little progress has been made in floating out any sort of logs. This condition has borne a little more severely on those owning cottonwood and gum than on the general hardwood interests of this territory but it has affected the movement of timber of all kinds.

Cottonwood grows comparatively close to the streams in this section. It is either on the Mississippi or its tributaries and custom has been that the greater portion of such timber by far has been handled by water instead of by rail. There is a dislike, too, on the part of owners of gum stumpage to use rail transportation where timber can be handled by water and this inability to make use of the river has interfered to some extent with the movement of gum logs to this centre. A prominent firm which is engaged in getting out timber in eastern Arkansas is authority for the statement that its work is practically at a standstill because of the low stage of the streams in that section and practically all interests depending on the water as a means of handling timber are finding their receipts somewhat restricted. It may be said, however, that the majority of the mills in this territory are still able to keep in steady operation and further that, if there is anything like a good spring rise, conditions with respect to log supply will compare very favorably with the average if indeed they are not even better.

Pertinent Legal Findings

SELLER'S DUTY TO FURNISH CARS

Many payers and seliets of lumber will be surprised to learn that there has never been any serious dispute over the question whether, when a contract to sell lumber calls for delivery f, o, b, cars at the place of shipment, the seller is impliedly bound to furnish the necessary cars, in the absence of express agreement to the contrary. But the fact is that such question has not only been frequently raised in the courts, but the courts have not been able to agree on what is the proper rule in such a case. The latest decisions on the point, however, lean toward the rule that unless the contract of sale shows that the buyer has undertaken to furnish the cars, it will be presumed that the seller obligated himself to procure them.

The Kansas Supreme Court has said: "It is our understanding that the phrase or formula, 'f. o. b. cars,' has by long usage and custom acquired throughout the business circles of the country a definite and specific meaning generally understood by all business people. When such phrase or formula is used in a business contract between a buyer and a seller of ordinary commercial commodities, where the use of a common carrier is necessary, the parties intend thereby that the seller will at his own expense do all that may be necessary to accomplish the loading and consignment of the goods to the buyer, including the placing of cars upon which to load the commodities sold; and when nothing appears to modify or limit this meaning, courts should enforce the contract so as to effectuate this intent. This rule is reasonable, it harmonizes with existing business conditions, and is the universal practice among business people. It is conceded that by this phrase the seller is bound to deliver the goods to the buyer by placing them on board the cars. How can he do this unless he secures the cars?"

A similar decision has been handed down by the Wisconsin Supreme Court, although that tribunal once adhered to the contrary rule.

But in other states the rule seems to prevail that under a contract for delivery f. o. b. place of shipment, the buyer is bound to furnish the necessary cars or vessels, unless the seller binds himself to obtain the same, or unless the buyer can show that by a general custom or by previous course of dealing between the parties, it must have been mutually understood that the seller would furnish the means of transportation. Thus it has been held by the United States district court for the northern district of Illinois that a contract to sell coal f. o. b. the seller's mines merely required him to load cars to be provided by the buyer.

MORAL.—When mutual understanding as to who is to furnish the necessary cars or vessel cannot be inferred from a general custom of the trade or from previous course of dealings between the parties, the contract of sale should expressly state who shall obtain the transportation equipment. Otherwise it may take a lawsuit to determine where the obligation rests, and in the meantime one party or the other has incurred liability in damages for breach of contract. Either the seller is entitled to damages for breach of the buyer's obligation to furnish cars, whereby the former has been prevented from making delivery, or the buyer will be entitled to recover on the theory that the seller wrongfully refused to make delivery.

SELLER OF BUSINESS AS COMPETITOR

When a lumber dealer or manufacturer sells his business, how far may be legally bind himself not to re-engage in the same line of business, and is any contract necessary to prevent him from competing with his successor?

Answering the second question first, there are repeated court decisions to sustain the statement that the mere fact that a lumber manufacturer or dealer sells his business does not prevent him from setting up a competing enterprise, but that his successor will be awarded legal relief against any attempt on his part to so conduct a new business that the public is apt to be deceived into believing that it is a continuation of the old concern; and in Massachusetts and perhaps one or two other states, it is held by the courts that a sale of the good will of a business implies an agreement on the part of the seller not to re-engage in a similar business in competition with the purchaser, on the theory that such restraint is necessary in order to protect the buyer in the enjoyment of his bargain. (89 Northeastern Reporter 548.) But the general rule is that the seller of any concern is left free to become his successor's competitor, unless he expressly promises, on some valuable consideration, not to do so. The consideration for such a promise is usually the purchaser's agreement to buy the business and good will at a certain price.

The important point to be noted in this article is that the law will not uphold such a contract if it unduly hampers the seller in re-engaging in business. It is not every express agreement not to re-engage in the lumber business that will be enforced. Originally, any agreement whereby a person attempted to bind himself not to resume a lawful occupation was declared by the courts to be invalid, on the theory that he, his family and the public are entitled to the benefits to be derived from his unhampered pursuit of his chosen vocation. The courts applied the principle that "competition is the life of trade;" but this strict rule has been greatly relaxed by the courts on recognition of the fact that it is a gross injustice to permit one who has sold a valuable good will to deprive the purchaser of the fruits of his bargain, by re-entering the business before the purchaser has become able to establish a reputation with his new trade. It is now a general principle of law that an agreement not to engage in competition with his successor will be enforced against the seller of a business, if it is no broader than is reasonably necessary for the protection of the purchaser in the enjoyment of the good will which he has bought. The test of the validity of such agreements, as applied to the lumber trade, was thus stated by the Florida supreme court in the case of Stewart vs. Stearns & Culvert Lumber Company, 48 Southern Reporter 19: "Whether such a contract unlawfully tends to restrain trade, or to a monopoly, cannot be ascertained by any accurately defined rules, but must be ascertained from a practical consideration of the circumstances of the case. Where an agreement is lawful in itself and is so limited that it will afford only necessary and proper protection to the parties, and will not materially or really injure the public it is valid, though it relates to and operates upon useful commodities." Thus what may be a reasonable restriction in one case would be unreasonable in another. For instance, a retail dealer whose business has been confined to a certain town and the surrounding country could not bind himself not to re-engage in the same business anywhere in the state. But the Indiana appellate court has sustained the validity of an agreement by a dealer in building materials, on selling his trade, not to compete with his successor anywhere in the same county. (Trentman vs. Wahrenburg, 65 Northeastern Reporter 1057.) On the other hand, all the decisions sustain the validity of an agreement of a hardwood manufacturer or wholesale dealer, whose business has extended over several states, not to re-engage in that business in competition with his successor in any of those states.

In some states the courts hold that the restriction as to time during which the competition is to be barred must be limited to such period as will enable the purchaser of the business to become acquainted with his trade; five years being treated as a reasonable period in most instances. There are many decisions in other states, however, to the effect that if such a contract is reasonably limited as to territory, it will be enforced, although unlimited or indefinite as to time. It will usually be found, however, to be safest to limit the time to five years.

DELAY IN MAKING SHIPMENTS

A lumber company is not liable for damages are tight of a criming delivering a shipment of lumber, arising from inability to procure cars, where the buyer's order was accepted subject to an avoidable delays. (Iowa Supreme Court, Wm. Cameron & Company vs. Cedar Rapids Lumber Company, 144 Northwestern Reporter 582.)

BUYER'S RIGHT TO REJECT LUMBER

Plaintiff contracted to sell defendant 150,000 feet of lumber, more or less, of a certain grade; 100,000 feet to be of certain dimensions and to be paid for at \$11 a thousand, and 50,000 feet of other dimensions at \$9 a thousand. Held, that defendant was bound to receive so much of the lumber delivered under the contract as conformed to the agreement, although entitled to reject any lumber which failed to come up to the grade contracted for, and that, therefore, defendent was not excusable in refusing to accept any lumber offered for delivery because fifteen per cent of the contract quantity was "No 2 common" instead of "No. 1 common," the grade bargained for. (Texas Court of Civil Appeals, Scanlan vs. Bland & Pisher Lander Company, 161 Southwestern Reporter 401.)

LIABILITY OF CONSIGNOR FOR FREIGHT CHARGES

A shipper of freight is personally liable to the railway company for the freight charges, regardless of whether he is the owner of the shipment, unless, to the railway company's knowledge, he is making the shipment as agent for another person. (Texas Court of Civil Appeals, Cheago, Rock Island & Gulf Railway Company vs. Floyd, 161 Southwestern Reporter 954.

WRITTEN GUARANTY OF PAYMENT NOT NEEDED

A statute in force in nearly every state provides that a contract to pay a debt owing by a third person shall not be enforceable unless it is evidenced by some writing signed by the person to be bound by the agreement. The Arkansas Supreme Court recently held, in the case of Brinkley Car Works & Manufacturing Company vs. Cook, 161 Southwestern Reporter 1005, that this statute did not apply to a promise by defendant to pay the price of lumber sold to a third person, where defendant was indebted to the buyer and where the seller of the lumber omitted to file a mechanic's lien on the strength of defendant's promise to pay the price. Defendant was held liable on his oral promise to pay for the lumber, on the theory that his contract was an original undertaking upon a new consideration.

ACCEPTANCE OF LUMBER BY BUYER

A person who contracted to buy lumber did not lose his right to reject delivery of inferior lumber by using a small part of it, while negotiations for an adjustment of the transaction were pending between the parties, he having offered to pay for the quantity used. (Texas Court of Civil Appeals, Continental Lumber & Tie Company vs. Miller, 161 Southwestern Reporter 927.)

REDEMPTION OF PAY CHECKS

The Louisiana Supreme Court lately sustained the validity of the law of that state which requires sheeks, punch-outs, tickets, etc., issued to employes for their services to be redeemed in current money, on demand. (Regan vs. Tremont Lumber Company, 63 Southern Reporter 874.)

RECEIPT OF CHECK AS FINAL SETTLEMENT

The more fact that the buyer of a carbond of humber sends the seller a check for a certain amount, bearing an indorsement or notation upon it to the effect that it is sent in full payment of all demands due the seller, does not constitute payment in full if the check is for a smaller amount than is admittedly due, although the seller retains the check and cashes it. (Alabama Cour of Appeals, Louisiana Lamber Company vs. J. W. Farrior Lumber Company, 63 Southern Reporter 788.)

RIGHT TO PENALTY FOR BREACH OF CONTRACT

Although a contract for delivery of logs at a sawmill provides for a penalty for breach by one of the parties, the other party will not be permitted to recover it, if the default is attributable to the fault of both parties. (West Virginia Supreme Court of Appeals, Mitchell & McNeeley vs. Davis, 80 Southeastern Reporter 493.)

PRINCIPLES GOVERNING SALE OF LUMBER

Two important rules of raw applicable to builder sales contracts were recently announced by the United States district control the western district of Michigan, in the case of A. G. Lehman Con pany vs. Island City Pickle Company, 20x Federal Reporter 1014. The first point is that if a manufacturer contracts to sell a quantity of certain commodities he is entitled to achieve arrives of the contract kind produced by another, unless the contract of sale expressly copies is the arriveles to be of the seller's manufacture. The court adds that this rule applies although when the contract is made the parties both helico that the articles will be of the seller's manufacture. The other point decided is that when one who has contracted to sell goods repudates the agreement and refuses to make delivery, the buyer's only remedy is a claim for the damages resulting to him in consequence of the breach; he has no right to sue to compel the seller to comply with the terms of his contract—a remedy which is open under a contract to sell land.

RENT FOR STORAGE OF LUMBER

The mere fact that a seller of lumber stored other lumber on the buyer's premises did not imply a promise to pay rent for the space occupied, although it might be found from all the surrounding facts and circumstances there was an understanding for the payment of rent. (Arkansas Supreme Court, Harris vs. Eagle Box Company, 162 Southwestern Reporter 49.)

RIGHT TO BENEFIT OF MILLING-IN-TRANSIT PRIVILEGE

A shipper of lumber resawed in transit was not entitled to the benefit of a milling-in transit privilege where the lumber was shipped from the mill under lower rates, fixed on order of a state railroad commission, than were in force when the lumber was shipped to the mill, one of the conditions upon which the privilege was granted being that a certain rate would be charged on the outbound shipment, and that rate having been reduced and the shipper having taken advantage of the reduction. (United States Circuit Court of Appeals, Eighth Division; Carson Lumber Company vs. 8t, Louis & San Francisco Railroad Company; 209 Federal Reporter 191.)

A New and Interesting Process

It would seem that wide possibilities have been opened up through a process for simultaneously bleaching and extracting the coloring matter from woods, which has recently been perfected and placed upon the market. The editors of HARDWOOD RECORD have seen samples of wood treated with this preparation, which is a patented article, and in some cases the results have been really astonishing. For instance, a specimen of mahogany was shown which had been bleached out by this process and it is difficult to imagine a more beautiful wood surface than the white, satiny piece which resulted. It would also be difficult to imagine anything more peculiarly adapted to piano work for the gorgeous drawing room or music room than this unusual class of wood. In fact negotiations have actually been completed with several piano concerns which will result in their placing at least a limited number of their pianos on the market finished in this way. The process has also been used in connection with bird's eye maple, entirely eliminating the objectionable yellowish stain which results from the ageing of this wood. It is used on red maple to make it white, on red birch to make it white and on other woods such as basswood and similar species which go into kitchen utensils.

The possibilities are too broad to enumerate. The idea of the process is to render different colored pieces of an equal color or to make colored wood absolutely white, as after the wood has attained the desired grade of whiteness any finish can be applied and the wood can be oiled, stained, shellacked or varnished in the usual way without any danger of future change in its color. This is a great advantage over the old method of whitening wood with oxalic acid.

One process for which it is particularly recommended by the makers, Francke, Phillipson & Co. of Chicago, is in the whitening of hardwood floors after they have been laid. This will make the selection of flooring material a much easier proposition, as uniformity of color when laid will not be entirely essential.

Progress of the Dimension Idea

The gradual recognition on the part of the lumber trade and consumers of lumber as well that real economy is served by the purchase of dimension stock has been accompanied by an effort to meet this requirement wherever possible without the necessity of performing any actual manufacturing operations.

Simply piling lumber according to width is a step in the right direction, of course, and the hardwood trade has been using this plan more and more of recent years, though it has been the rule in the big softwood mills for a long time. With the relatively smaller production of the average hardwood mill, as compared with the plant making yellow pine or cypress, separating the output with regard to width is somewhat more difficult, but once the piles are started the plan can be worked out without difficulty.

The chief trouble has been in getting a start. The additional yard room required for handling the stock on that basis, when most of the space is already taken up with lumber which has been piled rundom widths, presents a serious problem, and the difficulty of solving it is one of the chief reasons why many manufacturers and wholesalers continue to pile their stock in the same old way, even though they realize that it would be a big improvement to have it separated as to widths, in order to take care of special orders which come in requiring that certain widths only be shipped.

The situation was graphically indicated not long ago by a hard wood man who related the experience he had had in connection with a desirable piece of business on quartered oak.

"When we first got the inquiry of the buyer," he said, "the list of items wanted was so long that it looked as though we had received specifications for manufacturing dimension stock. But after we went over the list carefully, we found that most of the stock could be secured by the simple process of selecting the lumber for width. We examined typical piles to determine what we could do along that line, and concluded that we could handle the order. We did so, giving the customer just what he had specified in the way of width, and the results were satisfactory to him and to us."

The suggestion that the inquiry "looked like a dimension stock order," indicates how the average hardwood man shies away from anything of that nature, unless he has been trained to recognize the opportunities as well as the obstacles involved in handling lumber on that basis.

The lumberman who does not believe that he can pile his stock according to width, either because he has insufficient yard-room to permit starting over in this way, or because his output of any one item is not large enough to warrant him in offering anything but random widths, might adopt the plan used by a certain sawmill man in the Central South. It was developed at the request of a salesman of the company, who was constantly confronted with such questions as, "How does your lumber run for widths?"

"Ordinarily," he explained to the head of the concern, "I simply have to put up a bold front and make a guess, or I am compelled to confess that I don't know. And in this day, when nobody wants to buy a pig in a poke, but demands specific information about the goods we have to sell, it's necessary to give something pretty definite in making a bid for business."

The situation was met in a simple but effective way. The order went out that the tally record indicate the widths of the stock handled, so that it would be possible to report that a certain ear of oak had contained so much 6", so much 10", etc. The inspectors kicked on this arrangement at first, on the ground that it involved unnecessary work, but when it was impressed on them that the information was absolutely necessary, they began to keep their tallies in the desired form.

Copies of the tally-sheets were sent to the salesman, and when he entered the office of a consumer who wanted to know how his lumber ran, his reply was to take out the sheets which had been sent him, and present his proposition about like this:

"Here are the records of several cars of plain oak shipped during

the past week. They show 30 per cent of 6" and 7" stock, 40 per cent of 8" and 9" and the rest 10" and up. I can't guarantee that your stock will run that way, but judging from the fact that it has been pretty uniform, I think your lumber will be found to come pretty close to the figures I have given you."

The use of actual statistics and the presentation of copies of tally-sheets never failed to impress the buyer, who was accustomed to have salesmen paw the air and beat around the bush in a vain effort to keep from committing themselves. The result was that after the hardwood man began to give the specific information of lumber shipped, without having to bind himself with a guarantee that the lumber to be shipped on the order taken at that time would necessarily run the same way, orders came a good deal more easily, and complaints, likewise, fell off with almost startling rapidity.

The instance might be mentioned of a large manufacturer who regularly supplies his staff of salesmen with this information about every car shipped for each month. In this case the results have not been particularly good, because the labor of going over the list and digesting the information contained there, so as to make it of practical value as a selling argument, has been too great for most of the salesmen, who carry the sheet in their pockets without putting it to any real use. But this is not the fault of the system, but of the salesmen.

Plain oak, as a rule, is not piled according to width, but there is no doubt that it could be handled that way to good advantage in the yard with any considerable stock of this wood. Six and seven-inch stock could be piled with 12", 13" and 14", of course, and the narrower boards could be sold with the wide. Eight and nine-inch could be handled separately, and 10" and 11" piled alone. The result would be that the buyer, instead of taking random widths, even though with some information to guide him in his purchases, could order just what he wented and get that and nothing more.

Lumber piled in this way is not only more valuable to the consumer, but is more profitable to the lumberman. The buyer is willing to pay for the service performed for him in separating the widths, for the reason that he is saved the expense of manufacturing and the waste involved in ripping the boards to get the widths he needs. The same arguments apply to this proposition as are applicable to dimension stock generally, proving the point made at the beginning of this article, that the lumberman can frequently manipulate his stock so as to get the result of dimension production without actually doing any manufacturing.

It is worth noting, also, that most of the efforts to handle lumber more scientifically and with greater reference to the needs of the consumer are the result of necessity. When poplar slumped, those who continued to make money out of it did so by separating the widths, studying the needs of the consuming trades, and selling the stock accordingly. The consumer was benefited, because he was saved expense and trouble, and the lumberman not only got sales that he would probably have missed otherwise, but got bigger profits than he could have hoped for if he had sold his stock random widths.

The most successful handlers of oak strips are those who have not been content to follow the classifications established by the rules, but to divide and subdivide according to the requirements of individual consumers, not making the man who wants the narrower end of the strip stock take the wide, with the necessity of ripping and wasting part of the material, and not making it necessary for the consumer who needs 4 and 5-inch strips to take the narrower lumber as well.

Plain oak requires some such treatment as that today, and now, in view of selling conditions in that field, seems to be an excellent time to try out the idea. Those who dislike the idea of going into the dimension business can console themselves with the reflection that they won't have to use a single machine in getting the results desired by the consumer; while the latter will be willing to accept the assorted stock that he wants without haggling over whether the result was achieved in the mill or in the yard.

The Lumbermen's Round Table

INTERIOR TRIM AND FURNITURE

Manafactures who say that they are "Interested" only in the furniture trade fail to realize that they are parties to developments affecting that trade, which may not be directly connected with it.

The interior finish business, for instance, impinges on the manufacture of furniture at many angles, and affects it to a material extent. The man who is selling the furniture manufacturers and is disregarding those making interior trim is overlooking one of the important features of the situation.

This condition was shown very strikingly in a recent instance by the completion of a fifteen story office building in an Ohio valley city. The building is trimmed in mahogany, the door and windowframes, mouldings, etc., being of that material, while the veneered doors are splendid specimens of this class of millwork, being made with 1/4-inch figured mahogany faces.

The "class" of the interior trim is such that many of the several hundred concerns which have moved their offices to the new building have fitted their quarters with mahogany furniture and office equipment exclusively. The amount of business on mahogany furniture handled as the direct result of the use of mahogany in the interior trim is far up in the thousands.

The manufacturer of oak lumber, who wonders why the demand isn't what it ought to be, might talk to the architects who specify the character of the trim to be used and learn something to his advantage.

SELECTING FIGURED GUM LOGS

A well-known manufacturer of gum lumber, who has a mill in Mississippi, recently made the statement that figured gum logs can be selected without difficulty. This statement is opposed by veneer manufacturers, who point out that while a fresh-cut log will frequently give some indication of figure, this evidence is by no means conclusive.

"I have bought many million feet of gum logs for manufacture into veneers," said the representative of a large concern specializing in figured gum veneers and panels, "and I have been deceived in many instances. The "calico" appearance of the butt of a log which has been freshly cut is suggestive of figure, but I have seen too many of them opened only to display a plain instead of a figured surface to feel like relying on it to any great extent."

THE BASIS FOR INVENTORY VALUES

In taking an inventory of stock, what should be the basis for fixing the values of the lumber on hand?

It would seem that the cost of the lumber would be the fairest way to handle the proposition, and this would work very well in a wholesale yard. However, with the sawmill man, who has only a log-run cost to work on, and can hardly fix the cost of each grade, except arbitrarily, this plan is not exactly ideal.

Many lumbermen look to the market price as a guide for inventory valuations, and fix these \$5 below the market, this amount being sufficient to pay the cost of marketing and leave a profit to the seller. This is a good, practical plan, and is sufficient evidence that lumbermen are aware of the danger of taking values at anything like the probable selling price.

In connection with inventories, one finds the explanation for shrinkages in profits which are puzzling to many lumbermen. The past year was a good example of what is meant. If a lumberman took stock June 30, after a period during which values in plain oak had risen remarkably, his profits, as a result of this upward swing, would have been unusually large. At the end of 1913, however, with the pendulum swinging in the other direction, the reduction in inventory values would cause a corresponding shrinkage in profits which would be rather disappointing. Yet the actual business handled during the final six months may have been just as desirable and just as profitable, disregarding

what may be termed the speculative features of the market, as that taken care of in the hist half of the year.

A VENEER MANUFACTURING FALLACY

Not long ago a manufacturer of oak veneers agreed to get out some dimension stock for a customer at a price which was not only low, but actually below cost. The consideration involved was placing a large order for log-run stock of a kind on which a reasonable profit could be made.

The excuse for this sort of business may be, in this case, that the price paid for the log run material was sufficient to take care of the loss on the dimension stock. But this is merely an excuse, and not a reason. It is just as indefensible to cut a price in the hope of thereby landing an order for goods on which a profit may be made as it is to cut prices on everything. The difference is only in the degree. The reduced quotation makes it harder for everybody else to sell that particular kind of stock at a reasonable margin of profit; and consequently if everybody played that game, the entire market would be demoralized, and it would be impossible to make money even on the staples, which can be manufactured most easily.

The only safe way is to know the cost of each item and to charge enough above cost to make a profit on each item. The plan of robbing Peter to pay Paul, and using a below-cost quotation on one class of business to get other business on which a profit may be realized, not only smacks of the corner-grocery style of doing business, but is poor policy from every angle.

THE CONTAGION OF ENTHUSIASM

"How are you, Mr. Smith? Fine weather we've been having, isn't it? How's business with you? Only fair? Well, we might be doing more ourselves, but things are coming along pretty nicely after all."

And the lumber salesman who spoke these words grinned cheerfully, gave the hand of the consumer he was calling on a hearty clasp, and began to talk as optimistically as if he had just inherited a million dollars.

The consumer looked at him and smiled.

"I'm glad you came," he admitted. "A chap was in here this morning who was talking hard times until he made me feel as if the country was going to the demnition bow-wows. He created a kind of Blue Monday atmosphere, and when he left I was ready to go home and beat my wife. But your line of talk sounds better. What do you think of trade, anyhow?"

This particular salesman doesn't try to sell lumber on the strength of "hot air"; he knows that there are always two ways of looking at the same situation, and that it is good business for him and his customers to take a cheerful, silver-lining view of trade conditions, instead of insisting on business being intolerably rotten.

The difference in his favor in this case was exactly two cars of plain oak; and it was sold at a price that a calamity-howler would have branded impossible. A cheerful sentiment is a mighty good business asset, and a salesman simply can't get along without it.

PARCEL POST FOR VENEER SAMPLES

The increased weight limit of the parcel post system has enabled veneer and panel manufacturers to use the new service to a considerable degree. The usual plan, in shipping veneer samples, is to tape and hinge them, so that they can be folded into a compact bundle. Protected by a sheet of ½-inch stock on each side, they can be shipped easily and safely, as well as quickly and economically, through the parcel post. A well-known veneer manufacturer said recently that sampling is getting to be one of his best bets, and that the parcel post has enabled him to get out his stock so conveniently that he seldom thinks of using the express companies, except where much larger weights than are provided in the parcel post schedule are involved.

Methods of Forest Protection

Lumbermen and timber owners in general are becoming very much interested in the protection of their holdings from forest fires. It is estimated that ten years ago only about five per cent of the whole wooded area of the country received any attention whatsoever in the matter of fire protection whereas it has been estimated that, at the present time, approximately fifty per cent of our forests are patrolled or protected, at least in a rough way, from the ravages of the destructive forest fires. This remarkable progress in the matter of looking after our wooded areas is a natural result of the increased value of timberlands which is best indicated by the rise in stumpage values that has taken place in the past twenty years or more.

Now we have special associations for the protection of forests

from fire, cooperative organizations and even committees of lumber associations appointed to consider and devise the most efficient and satisfactory methods and costs of fire protection. Up to the present time the U. S. Forest Service has been the leader in this work in protecting the national forests from fire and in stimulating the adoption of certain protective measures by private owners. Various state forest departments have also been very active in the matter of not only looking after their own reserves but also in cooperating with lumber companies and timber owners in obtaining

the most efficient protection against forest fires. More recently many measures have been adopted to prevent the starting of forest fires in order to reduce the annual fire damage to a minimum by the introduction of special patrol, erection of lookout towers, equipment of locomotives with spark arresters, etc. It is estimated that at least thirty states now have on their statute books effective laws for the protection of both state and private holdings from forest fires. Some states like Minnesota and New York have even gone so far as to require the disposal of brush and slash after logging operations by piling and burning the brush or by lopping the tops and larger branches in order to reduce the fire hazard to the least possible extent.

It has been estimated by competent authorities that the direct annual loss resulting from forest fires is at least \$50,000,000, and that in the neighborhood of 20,000,000 acres are burned over every year. It is further believed that had fires been prevented on forest lands that are now unproductive because of these same forest fires, 32,000,000,000 board feet of lumber valued at least at \$64,000,000 could now be produced every year on this land. The amount of this loss is equal to eighty per cent of the total yearly lumber cut of the United States.

Some of the most disastrous forest fires ever recorded are still remembered by lumbermen in regions most severely attacked by fires. For instance in 1871 the great Peshtigo fire in the vicinity of Green Bay, Wis., resulted in the loss of over 1,000 lives, and

400 square miles of territory were burned over. In 1881, a. forest fire in the peninsula between Lake Huron and Saginaw Bay in Michigan burned over an area of 1.000,000 acres. The famous Hinckley fire in Minnesota in September, 1894, destroyed over \$25,000,000 worth of property, nine towns were wiped out, and 600 people were killed. The recent fire of 1910 in Idaho and Montana is too well-known to require description; suffice it to say that in the short space of three weeks approximately \$25,000,000 worthof splendid timber was destroved. Numerous other ex-

LOCATING A FIRE BY THE USE OF AN ALIDADE ON A TOPO-GRAPHIC MAP. NOTE THE 'PHONE WHICH IS USED TO REPORT THE FIRE AND ITS LOCATION.

have occurred within the past decade.

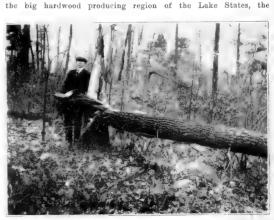

It is, of course, obvious that our great conflagrations and fire losses occur in the dense timber growth of the Lake States, in the Northwest, and in the Northeast. Maine, Pennsylvania, and New York have all suffered very heavily from fires. Coniferous trees on account of the resinous character of their leaves and bark are especially susceptible to burning. Wherever hardwoods grow by themselves there is not such great danger from crown fires. However, the fact remains that most of our best hardwood stands

occur in connection with coniferous timber as for example in-

amples could be quoted of some of the more important fires that

A SEVERE GROUND-FIRE SWEPT OVER THIS AREA AND KILLED PRACTICALLY ALL OF THE HARDWOODS.

FIRE OFTEN WEAKENS THE BASE OF THE TREE SO IT CANNOT RESIST A STRONG WIND.

southern Appalachians including West Virginia, eastern Kentucky, Virginia, eastern Tennessee, and western North Carolina, and in Pennsylvania, New York, and the Northeast. The lower Mississippi hardwood region is comparatively exempt from fire risk on account of the fact that in lowlands which are moist, serious fires are rare; but in the Ozark region and even in the Ohio valley as well as in the other regions, ground fires burning through the leaves do serious damage to standing hardwood timber. The damage done to the stands in the Adirondacks and Appalachian mountains is too well known to require further discussion here.

Another pertinent fact is that most of our hardwoods are very susceptible to injury even by severe ground fires and that fire killed hardwoods deteriorate in quality very rapidly. Aside from this fact, fire injured timber, even when not killed outright is often left in such bad shape that it falls a ready prey to boring insects and fungi and the result is almost the same as if it had been killed at first. Even the second growth hardwood stands that have been cut over several times in the East, including New England, south along the coast to Maryland, suffer considerable annual damage from recurrent ground fires. Several lumbermen and timber owners in this section have taken active measures to both prevent and control all forest fires. A good example is found in the Pocono Protective Fire Association in eastern Pennsylvania. This association has shown what can be accomplished in the way of preventing damage by fires through cooperation of the private owners of 100,000 acres, nearly all of which consist of hardwood timber. Expenses are met for this work by the annual assessment of six mills per acre of land owned by the association

In discussing the importance of the forest fire situation and methods of securing efficient fire protection, it is interesting to note the various causes of forest fires. In one large section of the country where in one year, 1,358 fires were reported, the following causes were recorded:

Causes Campers	Number . 346	Percent 25
Lightning	. 176	13
Railroad locomotives	. 273	20
Logging machinery, small sawmills, etc.	. 65	5
Clearing land	. 34	3
Incendiary	. 19	2
Hunters	. 15	1
Miscellaneous	. 60	5
Unknown or cause not reported	. 367	26
		-
Totals	1,358	100

Under "unknown, etc.," it is apparent that it would be impossible to detect in every case the exact cause of fire. It is astonishing, however, to note that of all the various causes listed, lightning is the only one that is not absolutely preventable.

In various sections of the country a great campaign of publicity and education in regard to forest fires is being waged which should cut down some of the most serious causes of fires such as careless campers, hunters, those clearing land, and those in charge of logging engines, sawmills, etc.

The principal and most successful methods that are now coming to be employed in the protection of timberlands from fire losses are the following: (1) patrol (2) construction of telephones and lookout or observation towers in connection with them (3) brush burning and lopping (4) use of roads, trails, and fire lines where necessary. In one part of the country the heliograph was used to flash signals under a code system, by means of the sun's rays, to report the location of fires that had started. In addition to these methods, legislative measures have been resorted to in order to compel railroads under certain conditions to use oil as fuel rather than coal; to clear out their rights of way, and to use spark arresters to prevent the spreading of sparks in the woods during the dry season. Other measures have been passed by many states restricting the burning of brush in clearing land to a few months in the year and imposing penalties for setting fire to the woods either through careless or willful action.

Very often a combination of various methods is used, such as the use of patrolmen, lookout towers and telephones. This has

worked out to splendid advantage in a number of regions under different conditions both by state and federal organizations and by private lumbermen and cooperative associations. Patrol work is really necessary only during an unusually dry and dangerous fire season. In the West, the Forest Service guards and rangers cover about 100,000 acres apiece on an average, which is entirely too much for effective work. In parts of Germany, patrolmen are expected to cover only from 1,000 to 5,000 acres. Look out towers have been used very successfully in locating incipient fires. They are placed on mountain tops or high elevations which command extensive views and with the aid of field glasses, observers can detect fires up to thirty miles away. In the West fires have been detected as far as one hundred miles distant in the clear atmosphere. On discovering a fire, the observer takes a compass direction to it and if he can get in communication with another observer by telephone, the directions are plotted on a map and wherever the lines intersect on the map, the fire is located and the proper authorities are notified at once. Telephone lines have been found to be almost indispensable in some regions. A single line built with a No. 9 galvanized iron wire can be constructed for from \$30 to \$50 a mile by attaching to living trees. The above is the method adopted by most of our states. New York, Wisconsin. Pennsylvania, and Maine have been the leaders in state fire protection work and since their reserves are scattered in with private holdings, the individual owner can cooperate with the state forester or warden to excellent advantage. New York has over 1,600,000 acres of forest reserves in the Adirondacks and the Catskills. Pennsylvania has practically 1,000,000 acres and Wisconsin about 500,000 acres in reserves.

Roads and trails are used to advantage as means of access in getting over the tract and also as a good place in which to check the advance of the fire. It is often necessary to construct trails in densely forested regions of mixed hardwoods and softwoods in order to properly control the area or to make the lookout stations accessible.

Under certain circumstances, especially in remote or inaccessible forest regions, caches of tools distributed at convenient points have been found to be splendid investments. Sometimes even food and rough camp outfits are stored along with caches of tools so that the toting of supplies which is often an important factor in putting out or fighting fires, does not hinder the progress of the work. Time is the big factor in putting out fires. As one lumberjack, well experienced in fire fighting, once expressed it, "Every fire can be put out with a stamp of the foot if you do it in time." If a fire is allowed to burn for several hours, undetected or without any effort to stop its progress, it may develop into a crown fire which under the presence of a high wind is impossible to stop.

The best tool to trench or directly fight a fire is undoubtedly the long handled shovel. This can be used both to dig a trench to the mineral earth and to throw moist earth directly on the spreading fire. Other useful tools are the mattock, cross-cut saw, axe and often a common rake.

In regard to cost, fire protection can be assured wherever fires are dangerous in our hardwood or mixed hardwood and coniferous forests by the expenditure of a few cents per acre annually at the outside. One large lumber association that uses patrol in the dangerous seasons and cooperates with the state in the use of telephones and lookout stations, secures very efficient protection for about two cents per acre per year. Another association during an especially dry and dangerous fire season spent as high as twelve cents per acre and considered it a splendid investment. The Western Forestry and Conservation Association, supported almost entirely by lumbermen, secures good protection from forest fire losses for between one and two cents per acre. This expenditure is really in the form of forest fire insurance and the various lumber companies have been well satisfied with the investment. Forest fire insurance has not been offered by any of the regular insurance companies in this country but in Europe it has been in use for some time. There is one large concern in Munich, Germany, which does considerable business in guaranteeing freedom from fire losses.

On well managed forest properties the premiums vary from \$1 down to twelve cents per \$250 value. The rate of course is made out for and differs with each particular tract.

There is no question but that in the future insurance companies will enlarge the scope of their policies to include the insurance of standing timber. This time will come just as soon as adequate measures are adopted by all the organizations interested in fire protection.

Several associations assess their members on a pro-rata basis per acre in advance of the fire season which has proved to be excellent forest fire insurance. During 1911 in one instance 954,000 acres were protected at an average cost of one and one-third cents per acre.

The following are the principal factors of cost in organizing a forest tract under an efficient system of fire protection:

- Character of timber growth and underbrush. It is obviously more expensive to protect dense, brushy timber than an open, clean, growth.
- 2. Topography or "lay of the land." Where lookout points can be established to advantage, it is a very cheap and efficient
- Accessibility. Telephones, roads, trails, etc., which areusually found near settlements are a considerable aid to fire protection. Sometimes, however, settlers are a great source of troublein brush burning, etc.
- 4. Location of emergency supplies of fire fighting tools, food and camp equipment. This is comparatively inexpensive and very efficient in saving time and trouble in getting to a fire.
- 5. Cost and efficiency of labor for patrol, erection of towers and telephones, building trails, etc. N. C. B.

Imports and Exports in 1913

The Bureau of Foreign and Domestic Commerce has published figures showing the imports and exports of forest products for the year 1913. For convenience of comparison, similar figures for 1912 are given. The value of the mahogany imported in 1913 was seventeen per cent greater than in the preceding year, as is shown in detail in the following table:

	1912.	1913.
Mahogany from England	1,724,381	\$1,761,206
Mahogany from Central America	1,113,823	1,101,809
Mahogany from Mexico	600,190	874,811
Mahogany from Africa	307,316	607,457
Mahogany from other countries	540,389	684,250
Total mahogany imports	34,286,099	\$5,029,513 \$ 743,414
Can in 1919 over 1917		φ 120,217

The largest importations of mahogany are credited to England. This wood does not grow in that country, but is collected there from all regions of the world where it grows, and is distributed to various countries.

Most of the African mahogany which reaches the United States comes by way of England; but there is some trade in this wood direct between the United States and Africa, as the table shows, and this trade was nearly 100 per cent greater in 1913 than in 1912. This indicates that American buyers of African mahogany are sending direct to the country where it grows. While the imports directly from Africa nearly doubled, there was a slight increase also of imports via England.

Imports from Central America for the same period declined slightly, while those from Mexico increased in value more than forty-five per cent. This is a matter of some surprise in view of the domestic troubles in that country. In spite of the civil war the mahogany cutters in that country seem to be able to get their logs down to the coast and to sell them at a good price.

The mahogany credited to "other countries" comes from various islands of the West Indies, the northern coast of South America, and from Panama.

The imports of sawed lumber are divided in two parts, that from Canada and that from other countries. A slight falling off is noted in both divisions, as the following table shows:

Sawed lumber from Canada		\$16,779,536 \$37,051
Totals	.\$17,883,048	\$17,616,587
Loss in 1913 from 1912	. \$266,461	

The imports of wood pulp increased more than nine per cent, and the increase was general, but greatest from Sweden, amounting in that instance to thirty per cent. Canada was able to slightly increase its shipments of pulp to this country. The table below gives the itemized imports of wood pulp:

			1912.	1913.
Wood pulp	from	Germany	2,629,377	\$ 2,348,036.
Wood pulp	from	Norway	3,108,850	3,657,924
Wood pulp	from	Sweden	3,722,564	4,833,398
Wood pulp	from	Canada	4.893,410	5,115,830
Wood pulp	from	other countries	549,017	400,329
Totals			14,903,218	\$16,355,517

The value of exports of forest products exceeds the imports threefold, and in most items the figures for 1913 show a moderate increase over those for the preceding year.

The total export of round logs increased slightly, but ash fell off.
Walnut and hickory increased. The details are given below:

wallet and nickory increased. The details are given by	CIOW.
Round logs- 1912.	1913.
Hickory \$ 296,435	\$ 330,911
Dak 147,127	68,859
Walnut 599,099	608,695
All other 2,785,752	2,912,802
Totals	83,921,267

	1912.	1913.
Hewed timber\$	689,698	\$ 879,906
Sawed longleaf pine timber	7,916,104	8,705,257
All other square timber	2,920,512	537,169
-		
Totals\$	11,626,314	\$10,122,332

Loss in 1913 from 1912.....\$1,503,982 Lumber constitutes the largest item in the export of forest products, and the increase in 1913 over the figures for 1912 amounted to about thirteen per cent. The table follows:

Lumber— 1912.	1913.
Cypress (half year, 1912)\$ 189,261	\$ 464,969
Fir	9,098,882
Gum 2,087,206	2,657,240
Oak 11,267,750	12,278,439
White pine (half of 1912)	1,612,437
Longleaf pine 16,613,887	21,231,225
Shortleaf pine 990,498	856,825
All other pine 5,973,512	4,276,787
Yellow poplar	1,566,448
Redwood (half of 1912)	1,458,625
Spruce	611,496
All other 7,350,742	6,968,351
Totals\$55,985,732	\$63,081,723

.. \$7,095,941

Gain in 1913 over 1912.....

The miscellaneous exports of products of the forest were eight per cent greater in 1913 than in the year before. The most marked decline was in shingles, finishing lumber for houses, and woodenware. Increase may be noted in railroad ties, staves, sash, doors, furniture, empty barrels, and wood pulp. The table tollows:

	1012.	1012
Rathrond ties (a dt of 1912)	81,116,104	82 896,529
Shingles	294,729	179,507
Box shooks	1/324,266	1,330,264
Barrel shooks	2,585,922	2.578,801
Staves	6,144,896	7 201,004
Heading	3340,867	325,643

1.21.1.6601	3.012.865
1.373 601	1.418.508
6 961 849	7 288,130
2148 1000	564 088
15,575	178,161
1 052 327	800.008
755,052	652,740
542,949	738 451
7,526,457	7.547,665
	6 961 849 048 100 45 575 1 052 027 755,052 542,049

The total exports of forest products in 1912 were valued at \$105,840,015, and or 1913 at \$114,777,513, the energies being \$8,937,495.

Bullet Wood of British Guiana

Bullet wood (Mimusops globosa Gaertner) is one of the common and at the same time one of the most important timber trees of British Guiana. It is a well-known tree and is variously called bully tree, horse flesh, beefwood, red lance-wood, balata rouge. There are several other tree species growing in the same region, called bully or bullet wood, but they are smaller and less likely to reach the market outside of their range of growth. It often reaches the English and American markets under the name of beefwood, but it must not be confused with the Australian beefwood (Casuarina) also called she-oak or ironwood. The latter is very light red, coarse and cross-grained and does not attain the same large proportions as the South American bullet wood which is brownish-red, somewhat resembling true mahogany. From a study of common names of trees in tropical America one is led to believe that the term bullet or bully wood is applied to any hard, heavy, and close-grained wood. This is true particularly of sapotaceous trees belonging to the genera Sideroxulon, Sapota, Bumelia and Dipholis. All the trees of these and several other genera yield a gummy sap which is collected and sold under the name of balata or simply gum. The term bullet wood is probably a corruption of balata.

Bullet wood is produced by one of the largest trees in British Guiana. It ranges from 100 to 125 feet in height and from five to seven feet in diameter. It is particularly abundant in Berbice, B. G., where the mature trees are said to yield logs about forty-two inches square and free from sap. The trees are without branches for nearly one-half of their total height. They generally have clean, symmetrical boles for thirty or forty feet, and like a number of tropical trees are provided with three or four stout and powerful roots which form enormous buttresses above the ground. The straight massive trunks are covered with a grayish-brown bark. The tree is an evergreen and has rather large, thick, leathery leaves which are dark green above and somewhat lighter beneath. Owing to the absence of distinct annual rings of growth, the age of a mature bullet tree cannot be accurately determined. It is known, however, that the rate of growth is exceedingly slow, and it is probable that a tree sixty inches in diameter is fully 400 years old, while others of still larger proportions are relatively older.

The wood is brownish-red turning darker with age and upon exposure to light and air. One writer states that the wood is red in color resembling the lean of the boiled salt-beef of the sailor, and this is probably why this wood received the name of beefwood. The trade recognizes three varieties-red, white, and black. All are cut from the same species and the reason for these three grades can be explained on the basis that the red is the true normal heartwood, the white is from young sappy trees, and the black is from the old over-matured trees which grew up in low mucky soil. The nature of the soil frequently affects the color and lasting qualities of the timber. The darker colored heartwood would indicate that the tree has taken up highly colored substances which have been deposited on the inner walls of the wood elements in the form of gum and resin derivatives. The darker colored grades of bullet woo'l are said to be more durable than the lighter grades. The white ants which are so destructive to the woods in the tropics do not

attack the heartwood of this tree, but the bark and sapwood are penetrated soon after cutting the trees down. As a safeguard against this pest, the bark and sapwood should be removed from the logs immediately after the tree is felled.

The wood is very hard and heavy often weighing seventy pounds per cubic foot. It is strong, having a crushing strength of 4.77 tons per square inch and a modulus of rupture of 16,000 pounds per square inch. The latter was determined by testing a spar six inches in diameter. Bullet wood is very tough and elastic which are two qualities required in fishing rod material. While this wood has not been used very extensively for this purpose it possesses the properties of a number of other good fishing-rod woods. The wood is very close and straight-grained and works very easily, but it is subject to serious heartshakes which unfit it for use in the form of large timbers for construction work. It is also liable to the attacks of the teredo and cannot be used successfully for marine construction. Some of the principal uses of this wood in British Guiana are for house building, telegraph poles, mill rollers and beams in sugar factories, field work, bridging, and spars. It is used also for making shingles and the native workmen frequently make planes of it. When the wind mills were still in use in British Guiana, the bullet wood was considered the best for the arms of the mill.

In purchasing bullet wood great care should be exercised to get the true kind. The forests are full of inferior kinds and the natives are prone to substitute worthless material in place of genuine bullet wood. There is good and bad bullet wood in the market, as is the case with a number of other important kinds. A timber known as "balata chien" which resembles the black grades of bullet wood is often cut and sold but it is practically worthless. The true bullet wood is considered the most important tree in South America, where it is taken into account that it yields not only very valuable timber but also a gum, the collection of which is controlled by special laws. This gum possesses properties which are intermediate between caputchouc and gutta-percha and is in great demand in the United States and in Europe for making chewing gum, candies, and a great variety of other purposes. The wood is sold at present in the New York and Baltimore markets where it brings from twenty to twenty-five cents per square foot.

Bullet wood is one of the easiest woods to be recognized by means of a hand lens magnifying from four to six diameters. It will be necessary before examining the wood to cut a smooth transverse surface by means of a sharp knife. It will be seen that there are numerous fine short rows of small porcs arranged in radial rows. In addition to these radial rows of pores there are numerous less conspicuous lines of soft tissue (wood parenchyma fibers) which run at right angles to the indistinct pith rays. These lines of soft tissue are invariably lighter in color than the harder and denser wood fibers between them. These characters which will always aid one in identifying the wood may be made to stand out more clearly under the hand lens if the smooth surface is moistened.

Indications are that most of the hardwoods will be exhibited at the Forest Products Exposition.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envolepe.

B 657-In the Market for Persimmon Logs

Glasgow, Scotland, Feb. 3. Editor Hardwood Riccord. We shall be alad to get the names of reliable shippers of persimmon logs, and trust you will favor us with all the information you have in this connection.

A short list of exporters of persiminon logs has been forwarded our correspondent. Editor.

B 658-Wants Market for Oak, Beech and Hard Maple Squares

Ockley, Ind., Feb. 43 Editor Hardwood Recogn: We are looking for a market for short red white oak squares. Also beech and hard maple squares, and red and white oak lumber sawed to specifications, and have been advised to write you for desired information.

This inquirer has been placed in touch with manufacturers of the material desired. Anyone interested may have the address mon an plication to this office. - EDITOR.

B 659-Wants 10/4 Soft Maple or Gum

Lester, Pa., Feb. 9. Editor Harawood Record: Am writing you in regard to special size 10/4 soft maple which I am going to buy, thinking that perhaps you would be able to give me the addresses of firms from whom I would be able to buy this. I want about two cars of 10 4 maple of the following specifications.

Ten per cent of the quantity that we buy must be any one of the following sizes:

8" wide and 16' long 5" wide and 16' long 8" wide and 10' long 5" wide and 10' long

Ninety per cent of the order can be any of the following sizes:

57" long and 8" wide 57" long and 214" wide 57" long and 5" 114" long and 5" wide

We can take any one of these sizes which it is easiest for the mills to get out. The lumber can also be in 57" lengths or multiples of 57"

We can use gum in the same sizes that we can use maple, although we prefer to get the maple.

If you happen to know of any mills who manufacture any gum or maple, kindly let us have their addresses.

The information asked for has been supplied. Manufacturers have ing this stock to offer may have the address .- EDITOR.

B 660-Seeks Northern Dimension Stock

Two Rivers, Wis., Feb. 10 .- Editor HARDWOOD RECORD: Please give us a list of lumber manufacturers who manufacture dimension stock. We would like a list of those who engage in sawing up northern woods. COMPANY.

This manufacturer has been placed in touch with northern dimension stock producers. His address is on file, to be supplied upon request .- Editor.

B 661-Spruce for Sounding Boards Sought

Saginaw, Mich., Feb. 13.-Editor HARDWOOD RECORD: Having benefited materially from the information submitted by your office recently regarding veneer manufacturers, we take the liberty of requesting the names of eastern concerns manufacturing spruce lumber that may appear on

There are a number of eastern firms that make a specialty of spruce for sounding board purposes furnishing the piano manufacturers, and it is with such firms especially I desire to communicate.

MANUFACTURING COMPANY.

Our files do not show manufacturers of spruce who make a specialty of supplying piano manufacturers with this stock for sounding boards specifically. However, the list of producers of spruce submitted the Michigan inquirer, we feel sure can get out this line of boards. Those desiring to have their names placed on our list as producing the material in question kindly communicate with HARDWOOD RECORD .-EDITOR

B 662-Wants Red Cedar Blocks and Slats

Liverpool, Eng., Jan 31. Editor HARDWOOD RECORD We are taking the liberty of writing you to ascertain whether you would be kind enough to let us have the name or names of reliable exporters of red cedar blocks and slats, to be situated in the Tennessee territory,

The names of a few exporters of red cedar have been given our English correspondent. Anyone desiring an opportunity of opening up negotiations with this concern for red cedar can have the address by writing HARDWOOD RECORD. EDITOR.

B 663-Gun Stock Needed

Onaway Mich., Feb. 16. Editor HARDWOOL RECORD: We would appre ciate very much if you would send us a list of the gun stock manufacturers in the United States.

A few names of gun stock producers have been sent the above. Anyone having it to offer and desiring the name of this correspondent will be supplied with same by communicating with HARDWOOD RECORD.

B 66+-Canadian Birch Wanted

Grand Rapids, Mich., Feb. 13. Editor Hardwood Record: Kindly tayor us with a list of Canadian mills who could supply us with birch, and obliga

The above request has been fulfilled. Any of our Canadian readers desiring to communicate with this American prospective customer will be furnished with his address upon application.—Editor.

B 665-Wants Veneer Stock

Ovid, Mich., Feb. 11.—Editor HARDWOOD RECORD: Please send us by return mail a complete list of manufacturers of three-ply veneer drawer bottom stock and single-ply veneer drawer bottom stock, and also manufacturers of three and five-ply oak, birch and maple veneer.

A list of sources of supply for the material sought has been sent our correspondent.-Editor.

B 666-Seeks Birch Flooring

Pittsburgh, Pa., Feb. 12.-Editor Hardwood Record: Will you kindly give us a list of a few manufacturers of birch flooring

The above wholesaler has been given a list of manufacturers of flooring referred to. His address will be sent upon request .- EDITOR.

B 667-Seeks Manufacturers' Auto and Buggy Bows

Detroit, Mich., Feb. 14 .- Editor HARDWOOD RECORD: Kindly send me a list of names of makers of oak or ash automobile and buggy bows.

A list as requested has been supplied. Manufacturers of this stock desiring to get in direct communication with this party may have the address on application.-Editor.

B 668-Wants Hickory Logs and Lumber

Memphis, Tenn., Feb. 17 .- Editor Hardwood Record: We are writing to ask if you would be kind enough to give us information as to where we can secure the names, directory, etc., of the manufacturers, consumers or brokers in hickory logs or lumber, either for domestic use or export.

Our correspondent has been supplied with a list of manufacturers of hickory lumber and logs. His address will be given to those wishing to negotiate with him for the stock sought .- EDITOR.

B 669-Wants Air-Dried Rock Elm

New York, N. Y., Feb. 17 .- Editor Hardwood Record: We are in the market for several mixed carloads of rock elm, air-dried lumber as fol-

 $\begin{array}{c} 4/4 \text{ firsts and seconds } 5'' \text{ and up wide.} \\ 6/4 \text{ firsts and seconds } 5'' \text{ and up wide.} \\ 4/4 \text{ No. 1 common.} \\ 6/4 \text{ No. 1 common.} \\ \text{We could use a steady supply of short boards and edgings not less than} \end{array}$ 36" long.

This correspondent has been given the names of manufacturers of rock elm. Anyone wishing to be placed in touch with this prospective customer may have the address on application .- Editor.

B 670-Seeks Market for Philippine and Borneo Hardwoods

The following communication is self-explanatory and will interest anyone seeking certain types of hardwoods growing in the Orient.-EDITOR

Righto Building, San Francisco, et al., Feb. 16. Editor HARRWood Racona. A triend, K. Ples residing at Samarinda, Koeter, Dutch East Bornov, advises in that he is deding in Modaye and Ipd el-Idilippin names for certain hardwoodse, and also in Bangkirai (a Bornovi from wood), and that he would like to make connection with American firms desiring to parchase these woods or possibly wishing to interest them selves in certain timber concessions that Mr. Ples has on the east coast of Bornovi accessible to deep water transcorration froilities.

If this would interest yourselves or any of your readers, it might be well to refer directly to Mr. Ples at the above address. I her to remain.

BINNAM BINNAPPIN, CONSUMING Engineer

B 671-Seeks Efficiency Engineer

Dayton, O., Feb. 19. Editor Hynowoon Recome: Do you know of a directelass experienced ethering entirior who specializes in hardwood lumber? We want to get in touch with the best firm in this line in the country by correspondence at one.

The above communication is from a foremost black walnut producer. Anyone interested in this inquiry can have the address on application.—Edwor.

B 672-Wants Thick Dry Plain Oak

Wankesia, Wis., Feb. 19. Editor (Lynowoon Riccom)—We are seeking several carbonds of 242 and 37 plant sawed white oak to be hone dry, suitable to immediately our into work. Can you advise us where we can seem this stock.

Company.

The above inquiry is from an agricultural implement manufacturing house, and while a possible source of supply for this requirement has been supplied, any others interested in the inquiry can have the address on application.—Entron.

B 673-Merchantable Timber

Philadelphia, Fa., Feb. 19. Editor (Aratwood Recom). Would it be possible for you to give us some definition of what you consider "merchantable timber?". We are having a controversy over what is "merchantable" in standing timber, and it you can give us any light on the subject we will very much appreciate it.

The above correspondent has been advised that "merchantable timber," as is anything which is defined as "merchantable," is timber which is salable.

It is a difficult thing to draw a strict line defining "merchantable stock" as timber of some sizes in some species is merchantable, whereas the same sized trees in another species would most decidedly not be merchantable. For instance, in spruce the timber is merchantable of a very small diameter, as it is used for pulpwood. Conditions as to soundness, availability, utility, etc., must also be considered.

Merchantable timber is less readily defined each year, as there is the constantly increasing difficulty of finding first-class stock in good sizes. Furthermore, increasing values make poor grades of timber merchantable.

As suggested above, this definition is purely governed by individual circumstances, and it is not possible to draw a strict line at any one point.—EDITOR.

B 674-Small Poplar Dimension to Market

Macon, Ga., Feb. 18. Editor Hardwood Record: We are looking for a user of small poplar dimension stock. Can you suggest a use for it? Do not manufacturers of small wooden pails use poplar in their manufacture?

Would appreciate any information you can give us on this subject.

This inquirer has been advised that he is right in supposing that wooden pail manufacturers use poplar, but that of course they require clear stock. However, it is very likely that clear cuttings could be marketed in this way.

A list of manufacturers of wooden pails has been compiled and forwarded to our Georgian correspondent.—Editor.

B 675-Spurious Mahogany

Under the above title an editorial was carried in last issue Hardwood Record protesting against inferior tropical woods of various kinds being marketed under the general name of "mahogany," when as a matter of fact they are not true mahogany, and buyers are misled. The article in question drew forth a protest from the Indiana Quartered Oak Company of New York, which is a purveyor of Philippine wood which it markets under the title of "Philippine mahogany." To this protest the following reply was made:

We have your favor February 16. Please bear in mind that when the editorial in question in our issue February 10 was written, it was

without the knowledge that you handled mahogany or any tropical woods. Hence, you will see that there was nothing personal intended.

The editorial was inspired by a debuge of specimens of spurious mahogany which are being received at this office every few days, which bear no resemblance whatever to true mahogany. Hence, mahogany buyers are protesting against it.

We are obliged to reiterate what was said in the article that there is no evidence at hand that any true mahogany grows in the Philippine Islands. We have in this office a complete list of Philippine woods, and specimens of all the leading varieties, and even the Philippine Forest Service makes no claim that true mahogany grows on the islands.

The specimens of wood which you send may be just as valuable in physical characteristics as true mahogany, but we are simply protesting against woods that are not mahogany being marketed under that name, just as we do when Californian white pine is marketed as Michigan white pine.

If you wish to have your protest and our reply thereto published in HARDWOOD RECORD, and will authorize it, we will be glad to give the matter room in our columns. Forrors.

In response to this letter the Indiana Quartered Oak Company submits the following letter, for which it requests publication in connection with the foregoing:

New York, Feb. 20. Editor Harrowood Record: In your issue of February 10, under the caption of "Spurious Mahogany," you mention 'Philippine Mahogany," as one of the chief offenders under this head. As the sales agents in the East of the largest manufacturers of this wood (which we have been importing for about five years), we feel enough interest in the matter to try to correct, in the minds of your readers, what seems to us your mistaken point of view. We speak only for ourselrers, and in regard to Philippine wood.

We sell this as "Philippine mahagany" and never omit the word "Philippine." It seems to us one has the same right to do this as all dealers have, when they sell most "African." You state cand we gladily admit your knowledge), that "there are only two or three genuine varieties of mahagany in the 'fifty-seven' shipped from Africa." Ought not, therefore, mahagany dealers to sell the other "varieties" under some other name?

If we should offer our wood under the local names of "Lauan, Tanguile and Almon," we would be kept busy showing customers and freight agents how to spell them. As we fully explain, our wood is not a true mahogany (and by the way you omit in your list any mention of the West Indian wood which the writer considers the true mahogany, but which nowadays runs small and short and is sold as "t'uban,")

It is almost impossible to distinguish some Philippine wood from some "African." A large user of our wood told the writer recently that "his foreman said he wished the Philippine wood had never come in the shop, as some of his oldest and best cabinet makers had gotten it into the work along with African as they could not tell the difference, and added, "I can tell the difference by the amount of our lumber bills."

Another customer had to get the writer to point out our wood from African, used in a large and costly motor boat.

The gist of the matter is this: Our wood should be (and is) sold on its merits, and for convenience, a trade name of "Philippine mahogany" is adopted, as is the case with most "African;" so with "satin walnut" or "hazel" for red gum, "bay poplar" for tupelo; "mountain oak" for any old oak, "Oregon pine" for Douglas fir; with this notable difference, viz.: the domestic woods have plain English names, whereas if we sent out our salesmen to sell "Tanguile," or "Balacbachan," our customers would think it was a new cigar or a drink. "The rose will smell as sweet by any other name." Our Philippine wood has been used by the same old customers for years, and they come back and don't care what we

You make one error we think, in saying "It would be just as feasible to utilize some of our native woods, such as birch and gum, and stain them to imitate the genuine mahogany." We recently sold Philippine mahogany to the largest piano concern in the United States. They said rived birch has got so high and so poor we are going to use your wood. It costs no more considering the quality and little waste." How about this, in connection with your "stained birch" suggestion? Most tropical woods have the peculiarity of growth like "genuine mahogany," in that when quarter-sawn they show a "stripe," "ribbon" or "roe." Also, the best of the "mear mahoganies" (like ours) "stay put," and work easily and run wide and long. Birch and gum do not.

The writer is an amateur cabinet maker of a quarter of a century and knows what he is talking about. There is no mahogany like West Indian to work, carve, polish or darken with age, but this wood has almost gone the way of the "cork pine."

For some purposes (not considering the less price) Philippine "mahogany" is better than "African" (we are speaking of African which is not botanically mahogany), because it is more even colored and shows more figure and "life" (when quartered) and is straighter grain.

None mahoganies are not burting real mahogany any more than poplar burt white pine or gum burt poplar, or tupelo has burt other gum. It is merely the natural trend of events, resulting from the sure and increasing disappearance of the timber of the world. In ten years from now South America will be bringing in here a substitute for "Philippine mahogany," and you will probably find us writing indignant letters to

spurrous Philippine mahogany' being offered to the poor MODEL HOLD innocent buyer

We also consider that we are bepetactors to the ultimate consumers. as many of them are now getting a Philippine mahogany table, where last year they bought for "genuine analogany" one with a birch top and INDIANA QUARTERID OAK COMPANA. soft maple legs

Monthly Meeting Philadelphia Exchange

The Philadelphia Lumbermen's Exchange held its regular monthly meeting on the evening of February 5. After supper the meeting was called to order in the exchange rooms by President Benjamin Stoker. This will be the last of the monthly meetings which include special social features, to be held under the present administration as the election of new officers and other annual business and 'ceremonies will take place in April. For this evening's entertainment the president invited James Edward Caltell, the mayor's statistician, and a remarkable adept at his profession, to speak on "Philadelphia." Mr. Caltell in his speech dwelt on the wonderful power this city wielded in the commercial and financial world, with its extensive manufacturing industries, strong and safe financial institutions, shipbuilding plants and railroads.

The regular meeting was then called to order at which the president announced that Gucker Brothers had been elected members of the exchange. Report of the committee attending the National Rivers and Harbors Congress in Washington, D. C., was next read; also a letter from the Washington Board of Trade requesting the exchange to join in the work of developing the national capital and making it the most beautiful city in the world. A resolution to that effect was passed. A resolution was also adopted at the request of the National Deeper Water Ways Association to write the state senators to vote favorably on the bill now before the House to purchase the Chesapeake and Delaware At the request of the National Wholesale Lumber Dealers' Canal. Association, it was resolved that the president and two other delegates be sent to represent the exchange at the coming annual convention in Buffalo on March 4 and 5. President Stoker subsequently selected Charles P. Maule and John E. Lloyd as the other two delegates to complete the committee of three. Action was also taken on similar requests from the American Academy of Political and Social Science and Chamber of Commerce

The meeting wound up with an interesting talk by Richard Torpin who claims to be the oldest lumberman in the trade today as he is seventy-nine years old. His comparison of the old with the present Philadelphia was very amusing,

Plans for the National Wholesalers' Meeting Progressing

Arrangements for the twenty-second annual meeting of the National Wholesale Lumber Dealers' Association to be held at the Iroquois hotel, Buffalo, N. Y., March 4 and 5, are progressing, and indications point to a large meeting. Secretary Perry states that letters received from memhers show an unusual interest in the meeting this year.

A number of important questions will be presented for consideration. The chairmen of the committees on bureau of information, railroad and transportation, fire insurance, forestry legislation and other committees. are at work with their committeemen and will have interesting papers to submit covering the year's activity.

The program and banquet committees are busily engaged in shaping up their work. Replies to invitations to the various trade organizations have been received not only from the wholesale and retail associations, out also from the National Conservation Congress, American Forestry Association, Railroad Business Association and others, so that the repre sentation will be general.

George S. Wood, manager of the Forest Products Exposition, was in New York a short time ago conterring with Secretary Perry, and the matter of the exposition will be given full discussion.

The annual banquet of the organization will be held at the Ironnois hotel. Thursday evening. March 5, at 7 o'clock. The plan adopted a couple of years ago, namely, that the ladies participate in the banquet with the men, will be followed this year, and it is expected that a large number of the members will bring their wives, daughters, etc. The social feature of the annual meetings has kent pace with the association interest taken in the business sessions, and the easy access afforded by Buffalo to the many members of the association and its natural points of interest, will afford an unusually good combination of business and pleasure.

Twelfth Annual Meeting

The board of governors of the National Lumber Manufacturers' Association has fixed the date for the twelfth annual meeting on Tuesday and Wednesday, May 5 and 6, 1914, in the audience hall of the Coliseum, Chicago, in connection with the Forest Products Exposition. The president and secretary were authorized to prepare a program to deal largely with the question of better methods of merchandising lumber. With this end in view, prominent architects, builders, wood preservers and representatives of the fire prevention and insurance interests will be invited to address the meeting, in order that the lumber manufacturers may get the views of the men who specify, purchase and consume lumber, as well as of those who would regulate and restrict its use.

Meeting Memphis Club

The Lumbermen's Club of Memphis at its last regular meeting on Tuesday, February 17, went strongly on record in favor of employers' liability law, and instructed the law and insurance committee to see that such a law along this line was passed that the interests of members of this organization would be thoroughly protected. This action was taken when it was made known that, at the coming session of the Tennessee legislature, an act of some sort covering this feature would be passed and the lumbermen believe that if such is to be the case, the club ought to lend its support to a measure that will be fair to themselves as well as just and conitable to employees.

The club also instructed the resolutions committee to draw up and forward to the proper authorities a strong protest against the proposition of the International Shipping Federation to insert in bills of lading a provision that, in case of strikes of stevedores or other causes leading to delay in the loading and unloading of vessels, shippers shall bear their pro rata share of any loss arising therefrom. The protest is to be sent to all the forwarding agents in the United States, to steamship officials on the other side and to the officers of the International Shipping Federation. It was suggested that this provision inserted in the bills would render the latter non-negotiable and impose still other undesirable handicans.

The river and rail committee reported that it had reached an agreement with officials of the Illinois Central whereby all over-rate claims would be refunded at Memphis instead of Chicago, where Memphis shippers are concerned. This agreement covers all over-rate refunds whether the shipments originate at Memphis or whether they are destined to this point. If they originate at Memphis it does not make any difference whether or not they are delivered on lines of the Hilnois Central. It also makes no difference if they originate on other lines, provided Memphis is the destination. The agreement, however, does not hold unless the shipments either originate here or Memphis is the destination thereof.

S. B. Anderson, chairman of the special committee appointed to raise the necessary funds to defray the expenses of the banquet tendered in November to members of the Lumbermen's Clubs of Louisville and Nashville and the delegates to the red gum conference, reported that he and his associates had succeeded so well that they had raised a surplus over and above the sum needed. Needless to say, this committee was given a vote of thanks and "honorable" discharge.

F. E. Stonebraker, who is chairman of the committee having in charge the furnishing of the rooms in the Business Men's Club to be used by the Lumbermen's Club, reported that these would be ready for occupancy before the end of the current month.

J. D. Allen, Jr., president of the club, announced at this meeting that

he had received a very warm personal letter from Secretary Weller of the Hardwood Manatacturers' Association of the United States, thanking lifts for the part he had taken in the recent meeting of that body. Formal resolutions of thanks to the club adented by the association before its adjournment here, were also received and ordered spread on the minutes.

John M. Pritchard, secretary of the Gum Lumber Manufacturers' Assoelation, told of the efforts being made to have the Chicago Lumbermen's Exchange building completed in red zum. He said that at present the matter was in the hands or 1 R. Gadd of the Wisconsin Lumba Company and that the latter would take the subject up with the McCormick interests, the owners. Mr. Pritchard asserted that every possible pressure would be brought to hear to have the building finished in red cum but asserted that the mahogany intelests sound the start and that they so far have the advantage in a slight degree

C. L. Harrison of the Himmelberger Harrison Lumber Company, was elected an associate member. Three other applications were received. These will be voted on at the meeting to be held February 28.

This was the second regular meeting held this year, the one scheduled for January 22 having been passed because of the annual of the Hardwood Manufacturers' Association. The attendance was quite full, there being fifty-five members and visitors present. J. D. Allen, Jr., was in the chair. The usual luncheon was served,

Committees of Philadelphia Association Appointed

Ralph Souder, president of the Philadelphia Wholesale Lumber Dealers' Association, has appointed the following committees for 1914: EXTERTAINMENT: Horaco A. Recves, Jr. R. Wyatt Wistar and Ben

MEMBERSHIP: Augustis J. Cadwallader, J. W. Turnbull, Joseph P. Comerys, Charles Atherton and A. C. Wood, RALBOOD AND TRANSPOLITATION Robert G. Kay, B. Franklin Betts and Gerge F. Craig.

Geerge F. Craig.

PANMA CANAL: Thomas B. Hammer, Owen M. Bruner, Walter J. Mingus, Kellam Bennett and R. B. Rayner.

American Folestry Advisory Committee: Robert C. Lippincott, J. Randall Williams, Jr., and Frederick S. Inderbill.

Annual North Carolina Forestry Association

The fourth annual convention of the North Carolina Forestry Association will be held in Asheville, N. C., on Wednesday and Thursday. April 8 and 9, 1914. The Appalachian Park Association and the Asheville Board of Trade are lending their hearty cooperation, and no effort will be spared to make this one of the most interesting and largely attended forestry meetings ever held in the South.

The program will include addresses by prominent men on the practical problems of the day, and discussions on each subject, open to all delegates, will be called for,

Two side trips of unusual interest are being arranged for with the land owners in connection with the meeting; one a visit to the celebrated planted forests of the Biltmore Estate, where forestry was first practiced in the United States; and the second trip over the unique logging railroad into the spruce forests on the side of Mt. Mitchell, the highest peak east of the Rockies, which are now being logged.

Such a program should be of equal interest to foresters, lumbermen, landowners and public men; and all who possibly can should plan to attend.

Monthly Statement to Continue

Responses to an inquiry sent to members of the affiliated associations some weeks ago by the National Lumber Manufacturers' Association asking for expressions in regard to the monthly report of cut and shipments. are strongly in favor of the continuance of this work, and a resolution was adopted authorizing the secretary to continue the publication of statistics, the cost of which it is estimated should not exceed \$100.00 per month. They will be continued.

New York Trade in Annual Banquet

Over 200 members of the local lumber trade with several out of town visitors and representatives of neighboring organizations attended the dinner of the New York Lumber Trade Association at the new Biltmore hotel, near Grand Central, on the evening of February 19. It is two years since the last dinner of the New York lumbermen and they certainly made up for the lost time.

It has been the policy of this association to have speechless dinners and to make the occasion one of absolute pleasure and enjoyment free from all suggestion of the daily grind. Following this there were no speeches but the after dinner feature was a rip-roaring vaudeville cabaret entertainment

The company gathered in the reception room about six-thirty and for an hour there were happy greetings between the wholesalers and retailers. At seven-thirty the diners sat down and after invocation by Rev. Dr. MacMurray of Brooklyn, the fun was on. The dinner was one of the best in the history of the association, and much credit is due Bernard L. Tim of the Hirsch Lumber Company, who had sole charge of this part of the arrangements. During the dinner a Neapolitan quartette and an orchestra were very much in evidence. After the coffee C. E. Kennedy, the wholesaler of 1 Madison avenue, who had charge of the entertainment features, announced that he had coralled the greatest bunch of stars in captivity and "if the entertainment wasn't the best ever he could be murdered." He is still alive. Kennedy took the party from the sublime to the ridiculous, following an operatic selection with

one of those present day numbers that are now so negatiar in the Broadway cabaret places. There were story tellers and dancers, one very flimsy diaphanous robe was a decided hit with the spotlight on in full tilt until "she" took a bow at the round of applause which followed the act. Everything was fine until the coiffeur fell on the floor, revealing in full size what resembled a white hope more than a ballet dancer. Of course Kennedy announced his regrets for the disappointment, and the show went on. It was a bang up affair and everybody had a good time and were lend at their arase of the constitute who good work

The Steel Car Question

At a recent meeting of the board of governors of the National Lumber Manufacturers' Association, it was announced that hearings on the Stevens' bill, which proposes to give the Interstate Commerce Commis sion authority to compel the installation of steel cars when and where in its judgment they are necessary, were held during January, and that the National association had submitted a series of mounted photographs covering various wrecks in which steel and wooden passenger cars had been involved, together with a statement to the effect that the lumber manufacturers, while not wishing to be understood as so desirous of selling lumber that they do not share the popular demand that the loss of life upon the railroads of the country shall be reduced to the minimum. simply request that the legislative committee and the Interstate Commerce Commission itself, not allow themselves to be influenced by the effort which is being made, apparently by those interested in the construction or steel passeager cars, to induce the public to believe that all cars constructed of iron or sheet steel are safer than properly built wooden cars.

It was also suggested that a careful investigation of the relative merits of both classes of cars new in service be made before any decision is reached, and the hope was expressed that the committee might recommend every possible measure to reduce the number of railroad wrecks. while at the same time considering the question of wreck proof cars

Coming Meetings American Forestry Association

The American Forestry Association announces from its main offices that it will hold the following meetings during the year:

May 15, spring meeting of board of directors, to be held at Cornell University, Ithaca, N. Y.

July 9 and 10, mid-summer meeting of the association to be held at Chautauqua, N. Y.

July 21, convention of American Forestry Association on American Forestry Association day, to be held at the Panama-Pacific Exposition at San Francisco

Canada a can With the Trade

Winchester Lumber Company to Erect Mill in Alabama

H. H. Mechlin, proprietor of the Winchester Lumber Company, Winchester. O., recently purchased a mill site and will creet a new mill on Davis Lake, at cr near Mount Vernon, Ala., a short distance below the junction of the Tombigbee and Alabama rivers. This is one of the most beautiful as well as, from a shipping standpoint, one of the most strategic points to be found in the state of Alabama. The lake lies close to the river and has an outlet into the Tombighee, which is fed by a large creek, the water in the lake being raised and lowered by the gulf tide. The lake affords a natural reservoir for the storing of logs.

The two rivers penetrate into some fine virgin timber and are navigable for a long distance. In addition there are smaller rivers and havous. Hence the timber is also accessible to this mill.

Mr. Mechlin is arranging to build one of the largest hardwood mills in the South, a structure modern and un-to-date in every respect, and is planning to confine his operations to the manufacture of hardwoods He will take with him to his southern operations a number of expert millmen who have been employed by him in the manufacture of hardwood lumber at Winchester, O.

Mr. Mechlin is one of the old school of Ohio hardwood men, having manufactured oak, ash and other hardwoods at Winchester for years. He is also a manufacturer of bent oak and bickory rims and sawed veneers, and for a number of years his output was shipped to foreign countries. Of late years, however, he has found the domestic market so receptive that he has given up the foreign trade and has confined his trade to home sales. Mr. Mechlin will remove his vencer and rim business to the new location, where with abundant timber, experienced men and the same push and energy that has characterized his operations in the North, a successful career is predicted.

Starts Business in Louisville

The Churchill-Milton Lumber Company is the style of a new addition to the hardwood trade of Louisville, Ky. This concern was recently granted incorporation papers and will operate with offices in the Lincoin building. John Churchill, formerly vice-president of the Booker-Cecil Lumber Company, T. S. Milton, sales manager of the Louisville Point Lum $\theta_{\rm eff}$ company and W. O. Harris, Jr., Leonsville attorney, are the principals of the concern.

In addition to the office, the concern will maintain a yard and will deal in southern hardwoods. The Lousville Hardwood Club elected the new concern to membership at its last meeting.

New Nashville Concern

The Wideawake Lunder Company has just started business at 71 Arcade, Nashville, Tenn., the concern being organized to operate in hard woods on a general wholesaling basis. Oak and poplar will be the company's mainstay, although it is planned to handle considerable ash, chestnut and similar southern hardwoods. A close connection has been made with several country sawmills whose output will be handled entirely by the new Nashville concern.

The backers of this new organization are H. H. Crossfield and W. K. Logan, both of Nashville.

New Arkansas Veneer Concern

The Morgan Veneer Company has been established to operate at Pin-Bluff, Ark. This concern is headed by W. B. Morgan, treasurer of the Anderson-Tully Company, Memphis, Tenn., and is formed to operate a tract of 75,000,000 feet of timber purchased from the McIntyre-Mann Timber Company of Pine Bluff.

The timber is on the Saine river and is excellent in quality and size. Mr. Morgan states that work has already been started on the company's plant, which will be in operation probably in the early part of May

C. W. Talge Take up Circassian Walnut Logs

Charles W. Talge, secretary and treasurer of the Evansville Veneer Company, Evansville, Ind., left Evansville, on Saturday, February 21, accompanied by Mrs. Talge, for New York. Mr. Talge will be principally occupied while in that city in clearing at the custom office a large shipment of Circassian walnut logs, which his company is now importing direct from Russia. The concern's output embodies a large quantity of very high-grade Circassian, although it also manufactures various other lines of veneers, and in fact is in a position to supply the trade with almost anything in this class of manufacture that it might have a call for

The company has only recently completed its model veneer plant at Evansyille, and in connection is an office which has been erected under Mr. Talge's personal supervision, which is a distinctly striking illustration of the possibilities of high-class interior work done in figured red sum.

The Kraetzer-Cured Lumber Company Incorporated

Notice of incorporation was recently issued by the Kraetzer-Cured Lumber Company, which is a concern organized by B. F. Dulweber of Ctincinnati. O., which will operate a splendid band mill at Moorhead. Miss. This concern has an unusually fine stand of timber from which to cut its logs, which run principally to oak and gum. This plan is to put the entire product of the mills through the Kraetzer Preparator, so that the company will deal only in Kraetzer-cured stock.

The company's operations are modern in every respect, great care having been given to the design and construction of the mill and the various accessories of the plant. It is expected not only that the stock will be turned out absolutely perfect in every respect, but it is also anticipated that it will be turned out very economically. In fact it is promised that this plant will be a model one in every respect.

Lamb-Fish Lumber Company Elects Officers

The annual meeting of the Lamb-Fish Lumber Company, Charleston, Miss., was held in Chicago on February 20. Garrett E. Lamb was elected president; W. B. Burke, vice-president and general manager; E. Louis Kuhn, vice-president; Scott Brown, secretary; R. B. McCoy, treasurer. The election of Mr. Burke as vice-president was due to the company's appreciation of his splendid efforts in behalf of the company.

Kentucky Operation Starts

The Turkey Foot Lumber Company with main offices in Marietta. O., has begun operations on a splendid tract of hardwood timber, sawing at its mills at Crestmont, Ky. The large double band mill has been installed and in connection a resaw, which will give the mill an annual capacity of 25,000,000 feet, principally of white oak.

The headquarters of the company will be located after March 1 in the Fayette National Bank building, Lexington, Ky.

Prominent Veneer Man Dies Suddenly

On Wednesday of last week, Otis E. Williamson of the Williamson Veneer Company, Baltimore, Md., died suddenly in Chicago, presumably of heart failure. Mr. Williamson was found dead on the steps of the Immanuel Baptist Church, South Wabash avenue. Chicago, and a coroner's jury returned the above verdict. The deceased had been stopping at the Auditorium hotel, being in Chicago on a business trip.

Mr. Williamson was a partner on an equal basis with his brother. D. W. Williamson, in the Baltimore concern. This concern was founded by the father of the two brothers in Indianapolis years ago. The business was moved to Baltimore some fifteen or twenty years ago, and has been carried on by the two brothers ever since, the deceased being the younger brother, and about fifty-four years of age at the time of his death.

O. E. Williamson was the leg buyer and foreign representative and had

charge of the foreign ousness, making regular trips to foreign countries in behalf of sales. He had been in the veneer business all his life.

D. W. Williamson, the brother, came to Chicago to take charge of the remains, which were shipped to Indianapolis and burled on Monday, February 23. Mr. Williamson leaves a wife, five sons and one daughter

Cincinnati Concern in Receivers' Hands

As a result of the appointing of a receiver for the carriage wood work firm of Ahr & Rost this week, Judge Caldwell has appointed Clyde Johnson and L. W. Radina Joint receivers of the lumber firm of L. W. Radina & Co., who are wholesale hardwood dealers with good sized yards in the west end. The appointment was made on petition of L. W. Radina and his wife, Julia Radina, who comprise the Radina firm, in which they set out that they are indorsers on notes of Ahr & Rost in the amount of \$32,900 and because of the receivership of that firm the notes become due at once and the Radina concern is unable to meet them. They say the liabilities of the Radina company are \$33,000 and the assets \$84,000.

Big West Virginia Timber Deal

One of the largest timber deals of which information has come to Baltimore from West Virginia was that whereby the Lost River Lumber Company, with W. B. Cornwell of Romney, W. Va., an attorney, as president, acquired possession of some sixty different tracts of stumpage in the territory known as Dutch Hollow, the Sperrys Run country, Baker's Run and a large part of the drains of Lost River, including 9.000 acres near Wardensville, W. Va. The timber area purchased lies in Hardy and Hampshire counties, and is estimated to contain not less than 100,000,000 feet, about seventy-five per cent of it being a high grade of white oak. Mr. Cornwell has been at work gathering up the loose ends of the deal for the last fifteen months, and the transfers are now being made. Besides Mr. Cornwell the officers of the company are: William Trappell, vice-president: W. M. W. McClaine, secretary and treasurer, and John J. Cornwell, attorney. Mr. Trapnell is general manager of the Hampshire Southern Railroad. The property is to be developed on an extensive scale, with a railroad running through the tracts. route for the line selected will probably be from Wardensville, Hardy county, eastward about fifteen miles to Strasburg Junction, on the Baltimore and Ohio and the Southern Railroads. This route is said to be the most practicable and the shortest. Two others are to be surveyed.

Eastern Furniture Concern In Control of Creditors' Committee

Julius Rayner, through his attorneys, recently filed suit against the Pooley Furniture Company to recover about \$1,800 alleged to be overdue. Edward Stein & Co. have entered judgment against the Pooley company for \$1,022 for want of defense. A few days later Judge Kinsey appointed Max Weinmann receiver of the company in a reported amicable suit brought in Common Pleas Court No. 1 by the Bank of North America, Lewis Thompson & Co., Inc., and Delaney & Co., creditors, and D. G. Pooley and W. F. Wagner, stockholders of the corporation. The company is capitalized at \$240,000 and since January, 1912, its affairs have been under the control of a committee of creditors. Judge Kinsey was informed that the business of the company was active and flourishing, but there was a lack of sufficient capital to conduct it. J. Howard Reber, attorney for the petitioners, said that more than ninety per cent of all creditors had given their consent for the continuance of the business, but it was in the interest of the creditors and stockholders if a sale were necessary, that the company should be sold as a going concern and it was the belief that this could be accomplished within a reasonable length of time. The company joined in the receivership proceedings and Mr. Weinmann's bond was fixed at \$100,000.

Important Timber Purchase in Arkansas

A tract of 15,069 acres of timberland in White county, Arkansas, lying along the west bank of the White river on the Memphis branch of the Iron Mountain on the north, and the N. and N. A. railroad on the south, has been sold to C. L. Goodwin of Greensburg, Pa., by Rudolph Stecher of Murphysboro, Ill. The land is known as the Stoneman-Zearing tract, and is principally bottom land, the timber being mainly gum, red oak, white oak, cypress and hickory, of importance in the order named.

The consideration named in the deed is \$150,690.90. There are no plans as yet for the manufacture of this timber. The Mark H. Brown Lumber Company, Mounds, Ark, has an interest in the property.

Big Hardwood Mill for New York State

A mammoth lumber mill for the handling of hardwood lumber will be constructed between Cranberry Lake and Childwold, N. Y., this spring by the Emporium Lumber Company which owns an 86,000 acre timber tract in this section. The new mill will cost \$500,000, completely equipped. Wagon hubs also will be manufactured. The decision to construct the new lumber mill was reached at special meeting of directors of the Emporium Lumber Company in Conifer, N. Y. W. L. Sykes, president of the company, has not yet decided where the lumber mill will be constructed.

Important Wisconsin Amalgamation

An important deal in the chair industry of Wisconsin has been consumated by the consolidation of four of the largest concerns engaged in that line, with the Wisconsin Chair Company of Port Washington as the

legal head of the combine. The other cans who agured in the transaction tion are the Northern Chair Company of Gritton, the Lake ide Craft Shop of Sheboygan and the Wisconsin Scating Company of New London All of these concerns were organized by I red L. Dennett of Sheboy ain president of the Wisconsin Chair Company. For the present each one will be operated separately. The amount of assets taken over by the Wisconsin Chair Company in the transaction approximate nearly \$700,000 and with its own assets the total will be more than \$2,000,000. Each of the four concerns is in prosperous condition and the combining of these industries makes one of the largest chair factories in the world. The Northern Chair Company is one of Grafton's growing industries, The Lakeside Cruft Shop for fifty charged is plant at Sheboygan and the Wisconsin Seating Company of New London is adding to its capacity. The company will continue to operate each factory under its original name.

Utley-Holloway Company Starts Business

The Utley Holloway Company is the style of the most recent addition to the Chicago hardwood trade and is composed of John B. Utley, who has retired from the Kerns-Utley Lumber Company, and Glenn H. Holloway, who has retired from the Holloway Hardwood Lumber Company, of that city. These two mea, who are well qualified to handle such an operation, will maintain offices at 501 and 502 Great Northern building in this city, until such time as the Lumbermen's building is completed, when they will move to that structure.

The Utley-Holloway Company is an incorporated concern, being cap italized at \$50,000, and the company's business will be to manufacture and wholesale hardwood lumber. Southern hardwoods will represent the bulk of the concern's stocks, although it will do some business in northern woods also. The new company will sell the output of four large band sawmills in the South, which will give it a good assortment for mixed car orders as well as facilities for handling large orders. It goes without argument that the concern will make every effort to serve its customers in a manner that will insure profitable and satisfactory business relations. As the mills with which this concern is connected are first-class operations which have a general reputation for the highclass character of the stock which they turn out, its source of supply is guaranteed to be high-class in every way.

Glenn H. Holloway comes from a family of lumbermen, having been born at Lebanon, Ind., where his father, A. M. Holloway, operated a large band mill. A. M. Holloway also owned and operated two circular mills, one at Thorntown and one at Cloverdale, Ind. G. H. Holloway was brought up in the atmosphere of the lumber business, living at Lebanon until he graduated from high school when he went to the University of Indiana. After finishing here he took an apprenticeship course In various Arkansas mills, serving in various capacities and learning the routine work of mill operations, lumber inspection, etc. From Arkansas he returned to Cloverdale where he acted as manager of his father's mill at that place until it burned down in the fall of '98, being there for one year, from whence he took a position as assistant manager in the railway timber and dimension department of the Fullerton-Powell Hardwood Lumber Company, South Bend, Ind. He shortly afterwards became head of that department and worked in that capacity for two years, when he and J. M. Schultz organized the Schultz-Holloway Lumber Company with offices in the Fisher building, Chicago. This

The second of the Markov Polymer and Markov Holloway sold out his interest and organized the Holloway Hardwood Lumber Company, of which concern he was president until the present

J. B. Utley has also been closely associated with the lumber business national Harvester Corepany. Mr. I fley started his active work in the lumber business with an apprenticeship course at the Edward Hines Lumber Company mills at Iron River, Wis., where he passed through the various departments, inspecting lumber, working in the office and doing ing works. From there he took a position with W. O. King & Co., Chicago, and after a year with this concern he organized the Kerns Utley Lumber Company with George F. Kerns, which concern was started in the early part of 1908. Mr. Utley served as secretary and treasurer of this company up to the time of severing that connection to form the present corporation.

Judging from the personnel of the Utley-Helloway Company, its splendid mill connections and its other features, there is no room for doubt as to the success which will attend its efforts.

A Busy Kentucky Plant

There is a plant in south as ein Kentheky, which judging from to ports as to its operations here, offers an excellent market for first class hickory timber, for such uses as vehicle wood stock and golf sticks. This concern is the Bassett Hardwood Manufacturing Company with headquarters at Monticello, Ky. This concern operates a plant at Mill Springs, one at Beaver Creek, Greasy Creek and Blackfish, besides a number of other mills which are cutting stock in large quantities. In spite of the large quantity of raw material which has been furnished, orders have been received for more stock than can be supplied by the various

It is the company's policy to purchase hickory logs and bolts of good quality brought in in small parcels by farmers and others residing within twenty miles or so of its operations.

The Bassett Hardwood Manufacturing Company manufactures large quantities of shafts, bolts, cross-bars, pole circles, reaches, rim strips. auto spokes and other stocks, and has recently gone into the manufacture of golf shafts. In the manufacture of the latter article a very high grade of second-growth clear, straight-grained hickory is required, and this stock is gotten mainly from neighboring points.

The Bassett company recently supplied the Ford Motor Company of Detroit with a large quantity of spokes which have been put into the famous Ford cars. The Bassett company recently constructed a 100-foot barge at Mill Springs, and is now installing an incline to haul the lumber and hickory butts to the Mill Springs plant from the river. It is receiving large quantities of stock on the Cumberland river below the Locks, which stock is finished at the Mill Springs plant.

Recently Joined Paepcke Leicht Forces

In this connection is shown a good likeness of James H. Walsh, who has for years been known in the eastern hardwood markets as one of the most able hardwood salesmen in the game. On October 1, 1913, Mr. Walsh joined the sales force of the Paepcke Leicht Lumber Company of

Ar Watsh came to the Paepide Leidit Lumber Company with an excellent experience actind him, beyong just served for five years with Dullimeter Brothers of Clicinnati in the same capacity and in the same territory. Previous to that time he spent a considerable period as an inspector at the mills of the Empire Lumber Company, Empire, Ark.

HARDWOOD RI, ORD Takes phasure in presenting herewith Mr. Walsh's likeness, and in giving to his triends in the trade these few suggestions is to his autocodents.

Addition to Glasgow Concern

Wight, Graham & Co. 7 Royal Bank Place, Glasgow, announce that they have taken into partnership in the timber department of the Glasgow business, George Howie, who has been in the service of that company as timber salesman for meny years. They have also admitted as partner in the London business, W. C. Davie, who has also been in the timbs employ for years, first in Glasgow and later in London, where the acted es manager of the London branch since its incention in 1900.

Timber Deal Consummated in Wisconsin

The Ahmapee Veneer & Seating Company of Algoma and Birchwood, Wis., last week closed up a deal whereby it becomes the owner of sixty-eight forties of hardwood timberland in townships 38 and 39, Wisconsin, of ranges 3 and 4. This timber was purchased from the John II. Kaiser Lumber Company of Eau Claire, the consideration being \$54,000. The timber is on the Thornapple river about three miles from Cameron Dam, made famous by John Dietz. There is timber enough on the tract to keep the Algoma and Birchwood plants running for twelve years, and together with former holdings, the company now has timber for twenty years' run.

As the tract purchased is surrounded by small tracts of hardwoods owned by individuals, the company will be able to buy considerable timber aside from that on its own property.

ber aside from that on its own property.

Senator M. W. Perry, general manager of the concern, has been endeavoring to secure this tract for the past ten years.

Prominent Lumberman Makes Important Change

Bruce Odell, office and sales manager of the Cummer-Diggins Company, Cadillac, during the past twelve years, has resigned his position to take the position of manager of a sawmill and manufacturing business in British Commbia.

Mr. Odell, with A. C. Frost and Paul Tietgren, of Chicago, Ill., has organized the Willow River Lumber Company, Ltd., of Canada, and will locate and operate mils at Willow River, B. C., at the junction of the Willow River and Fraser River on the new coast to coast line of the Grand Trunk Pacific Railway, about 450 miles east of Prince Rupert, the Pacific Terminal and 450 miles north of Vancouver. The officers of the company are Paul Tietgren of Chicago, president; Bruce Odell, vice-president and general manager; A. C. Frost, treasurer, and Frank B. Odell, secretary.

The company has purchased what is known in Canada as twenty-eight limits or twenty-eight square miles of choice spruce and fir timber. It is said to be one of the choicest tracts of timber on the line of the G. T. P. railway east of the coast and estimated to cut about three hundred million feet of lumber. As soon as possible a mill of about 30,000 feet daily capacity will be installed to be followed a little later by another

mill of 75,000 feet daily capacity, the smaller mill to be moved on a tract about seventy live miles west as soon as the larger mill is in operation.

Mr. Odell came to Cadillac about twelve years ago and has gained a graputation second to none as authority in the manufacture and marketing of lumber. He is an enthusiastic supporter of association work and was instrumental in the organization of the Michigan Hardwood Manufacturers' Association and was that association's first secretary. He also was chairman of the market conditions committee of that association since it's organization. Mr. Odell is vice-president and chairman of the market conditions committee of that association since it's organization. Mr. Odell is vice-president and chairman of the market conditions committee of the Cadillac Lumber Exchange. His many friends in Cadillac and throughout Michigan express regret at his heaving his many business associates, and his wise counsel and activities in the things he was interested will be missed. He, with his son, will leave for Willow River about March 10, and Mrs. Odell expects to join them in August.

D. W. Baird Enlarges Operations

The yard of the Newport Lumber Company, Chicago, located at 2919 Lumber street, has been purchased by the D. W. Baird Lumber Company, Fisher building, that concern's headquarters having been moved to the yard location. Some change will be made in the company's method of doing business in that it will handle storage and engage in general wholesale, retail and commission work.

The recent purchase gives to the D. W. Baird Lumber Company considerable storage facilities, dockage and trackage for fifteen cars; also a shed of a million feet capacity, and a yard with room for storing 1,500,000 feet of lumber.

Chicago Concern Reorganizes

George F. Kerns of the Kerns-Utley Lumber Company, Fisher building, Chicago, announces that he has purchased the entire stock of that concern and changed the name to the George F. Kern Lumber Company, being incorporated for \$50,000, fully paid in.

This concern has been operating under the former title since 1908, being manufacturer and wholesaler of hardwood and yellow pine lumber. Mr. Kern announces that the business of the company will continue on the same basis as it has in the past, and that the yard at Mounds, Ill., will also be continued at about the present size.

The Kerns-Utley Lumber Company started as a corporation and did an excellent business in southern hardwoods and pine since its inception. The George F. Kerns Lumber Company will handle the same lines of woods, contining itself strictly to southern hardwoods and specializing in oak, asla and other high-grade commodities.

Pertinent Information

Plan for Oak Exhibit at Forest Products Show

Prominent oak manufacturers make the following announcement:
The committee of oak manufacturers composed of W. B. Burke,
Charleston, Miss., E. L. Davidson, Parkersburg Mill Company, Parkersburg, W. Va., and Ralph May of May Brothers, Memphis. Tenn., came
to Chicago on Monday of this week to formulate plans for an exhibit of

BRUCE OBELL, SALES MANAGER OF CUM-MFR-DIGGINS COMPANY, CADHLLAC, MICH, WHO WILL SHORTLY EN-TER BRITISH COLUMBIA OPERATIONS

DAN W. BAIRD OF THE D. W. BAIRD LUM-BER COMPANY, CHICAGO, WHO RE-CENTLY MADE AN IMPOR-TANT EXTENSION.

GEORGE F. KERNS OF THE GEO. F KERNS LUMBER COMPANY. CHICAGO, FORMERLY OF THE KERNS-UTLEY LUMBER COMPANY.

the eak that, worthings of the Loss Products Laplestian at Chicago and New York. They see each specified have an excellent plan in mind for a springle which of the king of all woods the white eak tree. Porty odd it in New 1 the trade it we signified their intention to one a part of this exhibit and at least forty others are expected to particinate.

If you have not signified your intention to give your financial and in dividual support to this introduction of the product of the white oak tree to the general public as well as the architect, contractor and other workers of oak, now is the accepted time for your cooperation. The space all tited to the committee is well located and architects are now making designs for a special exhibit.

Shippers Not Liable for Pro Rata Loss from Delays on Bills of Lading

Tollowing the action of the Limiternan's Copy of Memphis in vigor ously protesting against the acceptance of bills of lading containing a clause providing that shippers shall pay their pro rata of any loss arising from strikes of stevedores or other causes resulting in delay in the loading or unloading of cargoes, as taken at the last meeting, replies were read at the meeting of the club held at the Hotel Gayoso, Saturday February 21, from the steamship lines themselves indicating that they had no intention whatever of adopting the suggestion of the International Shipping Federation, the originator of this idea. The manager of the American Atlantic Fransport Dominion Leland Red Star, White Star and White-Star-Dominion Lines, with headquarters at New York wrote that "the clouse in question has not been adopted by us and recent advices received from our principals in England make it very clear that they are entirely opposed to it and, this being the case, we think it unnecessary for you to concern yourselves further about it so far as our interests are involved." The Virginia Line, with headquarters at Newport News, also wrose that it had no idea whatever of putting the clause into effect. The impression created by these replies was that the matter was practically at an end as a result of the vigorous protest of the club and other shippers.

An Early Rate Decision Promised

The latest announcement from Washington is that the Interstate Commerce Commission will probably hand down its decision within three months in the matter of the application of the railroads to increase their rates on freight shipments five per cent. It was recently announced that President Wilson had intimated to the commission the desirability of as early a decision as a proper consideration of the matters involved will allow. Before that time it was currently reported that no decision would be announced in less than six months. No hint is given what the decision will be, but it is said that some of the railroads believe that it will be favorable to them.

Rehearing Missouri Ouster Decree Refused

The Missouri State Supreme Court has refused a rehearing in the famous Missouri ouster case, which was decided adversely to twenty-five lumber companies, with the resulting fines and demands that they remove their operations from the state of Missouri.

It would seem that the payment of the fines and continued adherence to the provisions of the drastic Missouri trust laws would make it possible for the ousted lumber companies to continue their operations within that state. Otherwise it would seem that there can be no way out of the difficulty except by appeal to the Supreme Court of the

United States, and even then a reverse decision would be necessary

Report on Car Statistics

A recent bulletin on car shortages and surpluses prepared by the American Hailway Association shows that of February 1, 1914, there was a surplus of 211,960 cars as against a surplus on February 14, 1914, of 199,385 cars. On February 15, 1913, the surplus was 52,700 cars.

The shortage on February 1 of this year was 2,282 cars as against a shortage on February 14 of 2,000 cars. The shortage on February 15, 1913, was 30,517 cars. Thus it can be seen that actual shipments do not seem to be starting out as well this year as last year, although since the middle of January there has been a slight increase in activity of freight.

Proposed New Lumber Rates in Lower Michigan

At an informal gathering of railroad interests and lumber shippers of lower Michigan before the Michigan Railroad Commission in Lansing, February 12, Commissioner C. L. Glasgow stated that the object was to get both interests represented and get both shippers and carriers to agree to some basis of rates that would be acceptable to both. It must be understood that the lumbermen of Michigan have gone on record as being favorable to the five per cent advance in freight rates to apply on lumber, provided there was a general similar advance of five per cent in official classification territory and that their competitors not enly in upper Michigan, Wisconsin and Illi-

noise estero in the problem of the problem of the competition with their own products must hear a similar advance With this understanding the railroads serving the eastern part of the state, which include the Michigan Central Railroad, Detroit & Mackinac Railway and Grand Trunk Railway, have issued turiffs at lumber in carloads on exactly five per cent above their present lumber rates. The railroads serving the western portion of the state, including the Grand Railroad state in Railroad and others have not issued tariffs as yet, because of the uncertainty of their acceptance by the shippers and also the Michigan Railroad Commission.

It developed that the railroads serving the eastern part of the state had granted shippers along their lines a comparatively lower scale of rates than that which exists on the western side of the state, and there was \$\frac{1}{2}\$ contention between the lumber interests involved that the scale of rates on lumber in carbords in the lower peningula of Michigan should be equalized, at least brought to a more common basis than heretoforehas been in effect. This proposition was objected to by the lumber shippers from the Saginaw valley and eastern side of the state as they did not care to have the basis changed in any way except the straight five per cent advance.

As a result of the conference the railroads serving the western side of the state agreed to check in rates practically five per cent in advance of the present rates, using the new proposed sixth class as a maximum and tariffs of the carriers on the western side of the state will be filed on this basis.

The lumber tariffs already issued and the proposed lumber tariffs will all be protested until such time as the general advance of five per cent goes into effect, otherwise the present lumber rates would not be changed.

The Exposition in Prospect

In this connection is shown a cut which gives at least an idea of how the Forest Products Exposition will look when it is finally in place in the Coliseam at Chicago. This cut has been prepared under the direction of Manager George 8, Wood of the exposition company.

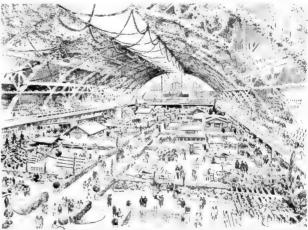

Manager Wood announces that during the month of January he and others connected with the exposition visited various important conventions and in every instance the subject of the Forest Products Exposition was enthusia-tically received and participation and attendance unanimously urged.

The joint resolution of the House of Representatives and Senate recently recommended unanimously by the Committee on Industrial Arts and Expositions, gives further impetus to the exposition and specifically provides for an unusual display by the Forest Service, which is now provided with \$10,000 for this purpose.

It is announced that as the time for the exposition approaches, it will be possible to give a more or less complete list of the exhibitors making preparations. On the whole, the entire proposition is working out very satisfactorily, and gives promise of entirely fulfilling the best wishes of those sponsoring the project.

Lumbermen's Underwriting Bulletin

Bulletin No. 69 has just been issued by the Lumbermen's Underwriting Alliance of Kansas City. The alliance has just closed its ninth and heaviest loss ratio year. The bulletin says that in looking back over the year and its happenings it seems apparent that notwithstanding the unusual weather

THE FOREST PRODUCTS EXPOSITION IN PROSPECTIVE; SCENE IN THE COLISEUM AT CHICAGO

conditions while were asponsible for the latter part of the losse, they were much beaver than they need have been had the emergency of the strain, on been 15 a.z. d by the mine people to the same extent it was realized by the alliance authorities.

The bulletin states that through the government weather bureau and reports of inspectors the alliance keeps posted as to weather conditions over the country. It says that hast summer when the heat and drought became pronounced every inspection report issued from the office destined to the districts that were baked contained warnings as to the increased danger due to weather conditions. Numerous special letters and special warning fire bulletins were issued and the employment of extra patrol the cleaning up of refuse and debris, the cutting of weeds and the general cleaning up of the premises were urged. According to the opinion of the alliance, if these warnings had been heeded and if the advice issued had received attention the losses should have been less heavy. According to the bulletin nearly \$1,000,000 of lumbermen's money went up in smoke in 1913 through the two leading insurance exchanges alone and much of this loss was preventable.

The bulletin then goes on to state that the alliance has striven in all carnestness to discover the causes of fire and to suggest effective preventive measures. It urges that effective work must be carried on without relaxation. The bulletin contends that it is not infallible regarding its information relative to fires, but that in its inspection rounds covering 428 risks it is reasonable that it picks up a great deal of very valuable information that should prove useful to the lumbemen.

The bulletin then urges closer co-operation between the mill man and the alliance and a recognition that the work is mutual and that the alliance exists for the benefit of the lumbermen, that it is at their service and that its recommendations are not made merely to be arbitrary or in a spirit of antagonism. It raises the question that in periods of unusual peril mill owners are sometimes prone to balk at additional expenses which comprehensive methods of safeguarding involve. It contends, however, that if a business is worth having it is worth saving.

The bulletin says that last year's heaviest losses occurred within the brief period of thirty-six days, in the month of August and the first part of September, during the latter half of the unbroken drought and heat. The extra expense for watch service during this period as well as for extra men for clean-up and drenching the premises would surely not have been prohibitive. There was not so great a percentage of fires to risks in 1913 as in 1912, but it is significant that the smaller per cent of fires destroyed a far greater amount of property.

Probable New Forestry Law for New York State

Lumber and pulp interests of New York state are much interested in a new forestry bill introduced in the legislature by Mr. Jones. The bill is

untiat in many to peets to toe law in torce in Pennsylvania and other states in that it gives owners of private lands the right to place their holdings under the jurisdiction of a conservation commission authorised in the bill. Where private lands are thus given over to the care of the commission, lumbering may be conducted under regulations to be prescribed by the commission. This is to assure the removal of mature timber only and thus preserve the lorest cover on such lands.

It is realized that New York is out of date in forestry laws, and several attempts to have such a law as now proposed cancided at recent legislations have failed. The Empire State Forest Products' Association and other organizations in the Adirondacks have been trying for a long time to have a more equitable conservation law spread on the books.

Forest Insect Control

Special investigations by the experts of the Department of Agriculturehave shown that as much as ninety-five per cent of the timber in some of the canyons and valleys of the Tuolumne river, California, which is to supply the water for the Hetch Hetchy project, has been killed by bark-boring insects. Some of the damage was done many years ago. As soon as the matter was called to the attention of the Secretary of Agriculture for such advice and assistance as his department could render through the expert who has charge of the forest insect branch of the Bureau of Entomology. The matter received the required prompt attention and arrangements were soon made for active warfare against the depredating beetle. A plan of procedure was outlined and the work was started just as soon as the weather conditions permitted in June, 1913.

The method recommended and followed was to fell the infested trees, lop off the limbs, pile them on the prostrate trunk, and set fire to it; thus the infested berk was secreted or burned to a sufficient extent to kill the broads of the insects. The trees thus treated ranged in diameter from six inches to fifty-four inches, with the average of about twenty-two and a half inches.

One thousand, six hundred and seventy-one trees were treated in the two projects, at a cost of \$1.15s, including all expenses except the salaries of two representatives of the Bureau of Entomology who directed and assisted in the work. It is claimed that this work, with an additional expenditure of about \$500 next season, will be sufficient to bring the beetle under such control that very little attention will be required to protect the remaining living timber from further serious injury. Both this and an infestation in the timber around the rim of the Yosemite-valley will receive the required attention next season. The Interior Department has expressed a determination to prosecute a warfare against the depredations of insects in the Yosemite and Glacier National parks to the limit of the funds available for the purpose.

The insect which is directly responsible for the death of such a large percentage of the lodgepole pine timber of the northern section of the park is known as the mountain pine beetle, the technical name of which is Dendroctonus monticolae (Hopkins). It attacks perfectly healthy trees and kills them by mining between the bark and wood in such a manner as to stop the movement of sap and kill the bark, which results in the final death of a tree within ten to twelve months after it is attacked. This beetle is the most destructive enemy of the lodgepole pine, western yellow pine, and mountain or silver pine of the entire Pacific coast and northern Rocky Mountain region. A vast amount of the best timber of these regions has been killed by this beetle during the past fifty years and has gone to waste through the agencies of decay and forest fires, but, thanks to the discoveries of the experts of the Bureau of Entomology, it can now be controlled and a great waste of forest resources prevented in the future.

Hardwood News Notes

W. J. Grossman of the Forrest City Manufacturing Company, Forrest City, Ark., was in Chicago a couple of days the latter part of last week. F. J. Kuny of the Williamson-Kuny Mill & Lumber Company, Mound City, Ill., has been in Chicago in conference with his local representatives, the Hardwood Mills Lumber Company, since Sunday of this week.

Walnut for Export

A lot of splendid assorted **American Walnut** logs, squared up and ready for export, are shown in the above photograph, which illustrates a section of our exporting yard at Kansas City.

All work, from the selecting of the trees in the woods to the final loading, is done by men trained in our employ and is under our close personal supervision.

Hence we can guarantee satisfaction in both export and domestic shipments.

FRANK PURCELL Kansas City, Mo. U. S. A.

VENEERS

Your profits depend largely on economical production, and uniformly cut veneers lessen the cost of production.

Our employes are experienced, our machinery modern, and we use the best selected logs in Mahogany, Circassian Walnut and Quartered Oak.

Therefore, we will furnish you with absolutely uniform and bone dry sliced or sawed veneers that your men can handle with a minimum outlay of time and labor.

This Means Money in Your Pocket

We will welcome you to our plant (which is so modern it's worth coming to see) or we will send a representative with samples, on request.

M. E. Leming Lumber Company MISS R CAPE GIRARDEAU

of the Young customers. He reported a good year in 1913 and looks for tair business from now on.

Another concatenation is billed for local Hoo Hoo under the direction d Charles J. Kammer, the strenuous vicegorent for this district. Mr. Kammer has a way of purring which generally brings out the cats and kittens and March 10 is sure to see a good crowd of felines at Risenweber's Circle hotel.

The office of the National Wholesale Lumber Dealers' Association is showing great activity these days. The force is busy on matters in connection with the Buffalo meeting. This week finds Messrs. Walcott, Edwards, Millard and Treadway in town in connection with association

S. C. Strock has severed his connection with the Interstate Lumber Company. The office of this company is now at the Jersey City yard.

≕≺ BUFFALO **>**=

As time draws near for the holding of the annual convention here of the National Wholesale Lumber Dealers' Association, the lumbermen are holding frequent meetings, arranging for details of the meeting. number of sub-committees have been appointed and M. E. Preisch has been made general chairman to look after the different features of the convention. The meeting place of the lumbermen will be at the Hotel Iroquois, Main and Eagle streets.

Jackson & Tindle are carrying on active mill operations at their new tract in northern Ontario, Canada. It is expected that quite a good-sized community will be built up, as the section is excellent for agriculture and will have a large amount of cut-over land for settlement. Most of the timber is spruce and whitewood.

J. N. Scatcherd, who is heavily interested in the door and finish business, through the mill in Batavia that he controls, said lately that it appeared to him that the Pullman Car Company is preparing to give up its practice of finishing its cars inside with metal, as it has lately bought a large amount of mahogany. Lumbermen have all along maintained that a car is just as strong and not any more combustible, if finished in wood. Such finish is more durable and better-looking than a steel-finished car.

President W. L. Sykes of the Emporium Lumber Company now located in Utica, but formerly of Buffalo, was in the city a few days this month, on his way with Mrs. Sykes for a short stay at Los Angeles, Cal.

Davenport & Ridley are getting in stocks of oak this month and also some maple from Pennsylvania. Trade is reported improving.

Miller Storm & Miller state that the hardwood trade is quite a little more active than during December and better than two weeks ago. A good stock of maple and oak is being received.

Hugh McLean returned a few days ago from his trip to the Pacific Coast, having been away from the city for about a month. The yard is booking a fair amount of business, mostly oak.

The yard of the O. E. Yeager Lumber Company has been getting in a good deal of stock in different hardwoods lately, much of it being oak, elm and basswood, with a good amount also of cypress.

The Standard Hardwood Lumber Company finds business picking up this month, with plain cak most in demand and about as much chestnut as usual selling at this time.

The National Lumber Company notes an increased demand this month for flooring, especially in oak and maple, with prices holding firm. There is also a better demand for hardwoods.

F. M. Sullivan, who recently made a western trip, found stocks well bought up. He contracted for supplies of ash and elm while away.

=≺ PHILADELPHIA **>**=

Charles K. Parry of Charles K. Parry & Co., says trading has brightened up somewhat this month, and outlook is encouraging. The Carolina Spruce Company, Pensacola, N. C., whose output they handle, is active setting out stuff, and at this time is cutting mostly spruce. In a recent shipment they selected from three cars a carload of red oak running sixteen inches and up all the way through, which is on the line of a considerable timber cut at this mill.

Fisher Dalrymple, Jr., of the Thomas E. Coale Lumber Company, reports accelerated business during the last month, with firm prices. He is optimistic as to the outlook.

The B. W. Cross Lumber Company, one of the associate concerns of the Thomas E. Coale Lumber Company, says business has quickened since first of the year, and prospects for the future are encouraging.

Walter J. Mingus of Mingus & Rutter reports a slight betterment in trading during the last few weeks and feels confident of expanded business by the opening of spring.

Charles G. Blake, manager of the Babcock Lumber Company, says a fair bunch of orders is being received. He looks for a general revival of business with the coming of settled weather. The many friends of Mr. Blake will be glad to hear that he is again at his desk although not wholly recovered from his late illness.

Frank Buck of Estate of Daniel Buck, and wife were among the recent arrivals at Palm Beach, Fla.

George Haskell, a retired carriage manufacturer, died at his home, Cynwyd, Pa., February 5, aged seventy-one years. Early in life he entered the carriage shops of his father. Ebenezer Haskell, on Arch street Philadelphia. After his father retired the business was carried on for some years as Haskell Brothers.

Joseph Miles, owner of the planing mill and lumber and coal yard. West Manayunk, Pa., died February 11, aged seventy eight.

Among the recent new incorporations are: The Lincoln Motor Car Wilmington, Del., chartered under Delaware laws, February 17, capital \$1,750,000; Universal Veneer Products Company, under Delaware laws, February 11, capital \$1,500,000; Rahway Lumber Company, Rahway, N. J., under New Jersey laws, February 18, capital \$25,000.

W. Z. Zener of G. Zener & Sons, Lancaster, Pa., died February 11. Mr. Zener was one of the most popular and well liked members of the Pennsylvania Lumbermen's Association. He was also one of the active directors of the Pennsylvania Lumbermen's Mutual Fire Insurance Com-

===**≺** BOSTON **>**=

The Lumber Trade Club of Boston held its annual meeting at Riverbank Court, Cambridge, February 19, and elected the following officers: President, Francis E. Page of Parker & Page Company; first vice-president, Wm. J. Barry of the Buttrick Lumber Company of Waltham ; second vice-president, D A. Lucey of the Curtis & Pope Lumber Company; secretary and treasurer, J. E. F. Downes of the Downes Lumber Company. The executive committee will be made up of M. E. Philbrick, J. E. Murphy and J. L. Barney. It is worthy of note that both the president and chairman of the executive committee are prominent hardwood men, and both have large yards in the East Cambridge district. Following the executive session an excellent entertainment was enjoyed by all.

Walter G. Jenness, formerly at 103 Pearson avenue, Somerville, has changed his address to 30 Park drive. Brookline

Recent visitors to the city the past week have included F. D. Mc-"lintic, hardwood manufacturer of Marlinton, W. Va., W. E. Berger, representing the W. H. Dawkins Lember Company, Ashland, Ky., and Frank F. Fish of Chicago, secretary of the National Hardwood Lumber Association

The New England trade is much interested at the decision of the Interstate Commerce Commission to investigate the entire rate situation in these five states, while it had originally considered looking only into the Maine Central on account of complaints lodged against that road. There are possibilities of a material effect on some lumber values if any radical changes are decided upon.

The Green Mountain Lumber Company has been incorporated at Boston with a capital of \$10,000. Joseph Green is president and Nathan Green secretary and treasurer.

-----≺ BALTIMORE >--

Perry R. Beck, one of the pioneer lumber inspectors of Baltimore, died February 13 at the home of his granddaughter, Mrs. Francis L. Klemm, at Halethorpe, a suburb. Mr. Beck was born in Kent county, Md., as a descendant of one of the original settlers of that section of Maryland, on October 14, 1824, and came to Baltimore when only twelve vears old. In the early days of the lumber trade he became an inspector, following this occupation until his return to Kent county, to engage in farming. When advancing years forced his retirement he made his home with his granddaughter. A son survives him, besides Mrs.

Edward P. Gill of the well-known firm of Wm. D. Gill & Son, is at Hot Springs, Ark., for another period of treatment for the rheumatic trouble with which he has been afflicted for some time. When at the resort last year Mr. Gill experienced such decided benefits as to encourage the hope that he would be able to get rid of the malady entirely, though he realized that a number of trips would probably be necessary.

L. H. Bowman, sales manager for the R. E. Wood Lumber Company, Continental building, who had been ill at his home in Walbrook, is back at his desk once more, feeling energetic and taking hold of details with a vim.

Frank A. Parker of Mann & Parker, Inc., Continental building, is in the North on a selling trip which is expected to keep him out until the latter part of March. The firm has taken up a large lot of lumber in the South and expects to do a good business.

-----≺ COLUMBUS >=

The John G. Simon Lumber Company of Cleveland has been incorporated with a capital steck of \$25,000 to deal in lumber of all kinds, both wholesale and retail. The incorporators are George Bayard, L. M. Johnstone, R. J. Fitzgerald, A. L. Reimer and F. T. Peitch.

The Charles Hoffritz Cigar Bex Company of Dayton has been incorporated with a capital of \$25,000 to manufacture cigar boxes. Those backing the company are E. H. Hoffritz, F. C. Hoffritz, C. W. Hoffritz, E. C. Hoffritz and O. Reichelderfer.

Lee B. Pennock, formerly postmaster at Urbana, Ohio, has leased the old Hubbard lumber yard on North Russell street, where he will operate in the future.

The Kraetzer Cured Lumber Company of Cincinnati has been incorporated with a capital stock of \$100,000 to do a general lumber busi-

The Ohio legislature at the recent extraordinary session changed the workmen's compensation law in order to define the phrase "wilful act" which caused considerable trouble in the courts of the state. Under the amendment the employer is better protected.

The Lake Eric Box Company of Sandusky, O., has been organized to make all kinds of crates and boxes. The plant will be located on the south side of Scott street between Hancock and Warren streets. Albert Weber and Louis Stroh are the partners in the business.

Citizens of Zanesville, O., are making an effort to retain the location of the plant of the Henry J. Kimbal Bent Wood Company, which was sold recently to the Rudd-Hayward Lumber Company of Marietta. The latter concern says the plant will be dismantled and moved to Marietta unless some interest is shown by Zanesville business men.

The Columbus Manufacturers' and Jobbers' Association has voted to merge its traffic and publicity activities with that of the Columbus Chamber of Commerce. It will retain its old officers and keep in touch with its members in that way.

R. W. Horton, sales manager for the central division for the W. M. Ritter Lumber Company, reports a fairly good demand for all grades and varieties of hardwoods. Prices are generally well maintained and there is a tendency to increase the volume of business. Vardmen are now buying better than factory purchasing agents. Mr. Horton looks for a good trade in hardwoods from this time on

John R. Gobey of John R. Gobey & Co., says there is a good demand for all hardwoods, and prices are strong in every particular. He believes the future will be more active.

J. A. Ford of the Imperial Lumber Company reports a good movement of hardwoods, especially from West Virginia, with prices holding up well,

----≺ TOLEDO >----

A few of the local hardwood concerns report price-cutting, due in general to competition or the need of ready money. As a rule, though, prices are holding up well. Demand is good and building continues excellent.

The Booth Column Company was awarded a splendid municipal contract the past week when the town of Wooster, Mass., chose this company to supply it with 475 columns to be used in its street-lighting project. The company reports business showing a steady increase. The directorate of the company for the new year includes: W. S. Booth, R. A. Landers, W. T. Hubbard, E. N. Crumbaugh, and Mrs. M. E. Booth.

F. B. Anderson of the Skinner Bending Company is enjoying a sojourn in the South. He has been spending some time at the company's plant in Stuttgart, Ark.

An increase in its capitalization from \$60,000 to \$250,000, recorded by the Gotshall Manufacturing Company, is of much interest. junction the firm has also acquired the properties of the Gotshall Brothers Company at Archbold, O., and the plants of the E. W. Worman Company at Vickery and Whitman. All these concerns have heretofore been operating independently, although under the supervision of the Toledo company. Mr. Worman, who has operated the Vickery and Whitman factories for the past eight years, will act in the capacity of assistant manager at the Toledo plant. Other officials of the local plant are S. D. Gotshall and I. W. Gotshall. Beside the out-of-town branches just taken over, the Gotshall Company maintains other branch factories at Delta, O., Swanton, O., Blissfield, Mich., Ogden and Fremont, O.

-----≺ MEMPHIS **>**--

George C. Brown & Co., Proctor, Ark., are preparing to resume operations at their big plant about the first of March. This is one of the big mills in the immediate Memphis district, that has been out of commission for some time. This course was adopted by the management in order to prevent a recurrence of the heavy damage sustained by the overflow of last year and the year before. There is nothing now to indicate that there will be any overflow this season but the company is in shape if such a development does take place. During the suspension advantage has been taken of the shut down to make necessary repairs and improvements and the plant will be operated to good advantage when it resumes

H. M. Wheeler, who a short time ago sold his interest in J. W. Wheeler & Co., Madison, Ark., has become the bead of the Jonesville Hardwood Lumber Company at Jonesville, La., and has already entered upon the duties of his new position. This firm owns extensive timber holdings in the section tributary to Jonesville and a new mill will be erected as soon as possible. The plant of a stave company has been leased and this will be used until the new mill is in readiness for operation. Mr. Wheeler sold his interests at Madison to William Pritchard, of Memphis, who is now joint owner of J. W. Wheeler & Co. with C. L. Wheeler.

The Jones Lumber Company of this city has made arrangements for removing one of its Mississippi mills to Arkansas, and plans to remove two others in the near future. The plant which is to be removed at once will be taken from Grenada, Miss., to Hamburg, Ark. This company works hickory almost exclusively and has earned the title of "Hickory" Jones Lumber Company. Its offices are in the Scimitar building here.

The Higden Lumber and Manufacturing Company at Higden, Ark, has taken over 4,000 acres of timberland located in Van Buren and Cleburin counties, Arkansas. The groperty was owned by the Baker Lamber Company, and included in the transfer was much formetly operated by this new. The transaction involved an outlay of about 860,000

Announcement is made that T. B. Ashby of Jackson Tenn, has closed negotiations with business men of lattle Rock whereby he will establish a sensor plant in that effty, involving an outlay of about 8000,000.

Practically no lumber times were involved in the Induce of the Mercurtile Bank here which was caused by the poculations of its president, c. Hunter Raine. The shortage is \$1.063,000 or about one half of the original total assets of this institution. In order toat there might be no apprehension regarding the other banks, the Charmy House Association Issued a statement decarring that the charbin of the bank was due to the losses incurred through its president, that the other banks were in no way involved, that financial conditions here were thoroughly sound and that the other banks belonging to the association were in as good shape financially as, if not better than, ever before.

Newspaper dispatches report the tynching of Buck Mevirk near Herrando Miss, by a body or citizens fiving near that place. He recently shot J. K. Ingram, a prominent million of Byhalm, Miss, was tracked by bloodhounds, captured and placed in fail. He was being removed from the jail at Hernando by the sheriff when the posses stopped the train, covered the official with guns and took the prisoner away from him. He was strong from a steel bridge and left hanging all night. The lynching believed the confession of the nexto that he was guilty of the assault on M. Ingram. The latter is slowly recovering here from the rithe bullet, which entered his back just above his kidness. He seemed glad to near that the would be marderer had not such a rate but expressed regret that his friends did not wait long enough to allow him to recuperate sufficiently to be one of the bruchurg party.

David Lee, head of the Eagle Funtiture Company, has been re-elected president of the Retail Furniture Dealers' Association of this city, while T. J. Beasley has been chosen to succeed himself as treasurer. This organization has for its principal purposes the placing of credits on a sound basis and the general protection of those engaged in the furniture business. Practically all of the thirty-three firms here are identified with this body. The State (Tennessee) Furniture Dealers' Association will be bere in May, about 700 delegates strong, and the local association will arrange entertainment features and otherwise provide for the contort and pleasure of the visiting dealers.

James E. Stark of James E. Stark & Co., together with the other Memphis business men who went to New Orleans to appear before Secretary McAdoo February 12, to present the claims of Memphis for one of the regional reserve banks, has returned. Mr. Stark was the special representative of the lumber industry and was able, through his presentation of facts covering the lumber business of this city and section, to make an exceptionally good impression upon the government officials. In fact the claims of Memphis were presented with such emphasis and the eyes of the government officials were so opened regarding the volume of business transacted here that they asked for additional information, which is now being prepared to be forwarded to them on their return to Washington. The lumbermen are very anxious to see Memphis secure one of these banks and are co-operating in every possible way to this end.

■ NASHVILLE >=

President Charles M. Morford of the Ragland-Baxter-Morford Company, lessee of the Edgefield & Nashvillic Manufacturing Company, reports some important building enterprises in the South. Mr. Morford's company is one of the largest interior finish and furniture concerns in this section, and took over the preperty leased some months ago. The company has contracts for the interior work of the Healey building, 16-story structure in Atlanta to cost \$1,000.000; Tutweller hotel, structure at Birmingham to cost \$1,500.000; Ridgeley apartments, one 2-story building at Birmingham, and is making important progress on a 12-story addition to the Seelbach hotel at Louisville. Mr. Morford says that inquiries received indicate that plans are being made for numerous ether imnortant buildings in the South.

Recent rains have caused the Cumberland river to rise, and logs have begun moving. It is believed the tide will bring several million feet of poplar, oak and other logs to market within the next ten days. It is believed that 10,000,000 or 15,000,000 feet of timber is ready to be moved to market in the upper river country.

T. F. Bonner, president of the Bonner Furniture Manufacturing Company, says that the outlook is very bright in the furniture trade. Mr. Bonner seys his company is steadily increasing output. The company is having plans made for another warehouse at its plant in West Nashville to facilitate output.

The plant of the Nashville Hardwood Flooring Company has resumed after having been closed to install new equipment, including four immense boilers. The Gooring business is reported in good condition at

Vicegerent Olia White of the middle Tennessee jurisdiction has issued a call for a concatenation of Hoo-Hoo to be held in Nashville the second Tuesday in March. The concatenation will be held simultaneously with the annual meeting of the Nashville Lumbermen's Club, when the club will slend officers A interesting program will be arranged.

THE GLUE THAT IS APPLIED COLD -

In Flush Veneered Doors

The chief consideration is uniformly highgrade glue. Manufacturers of this modern type of door realize that its development has been retarded because the unavoid able lack of uniformity in other types of glue makes it impossible to know how long a door will stay in condition. The

Of vegetable glue insures absolute uniformity because of the very nature of preparing it and because every pound of our raw material is rigidly inspected.

Vegetable Glue

Is also a rigid and permanent adherent: will not blister in sanding; has no disagreeable odor; will not deteriorate in standing—for a week if necessary; and can be applied cold without any heating application of any kind in the glue room. In addition, the average saving over former glue bills has been twenty per cent where vegetable glue is used.

A DOOR MAKER SAYS: firmum manufacture and

THE GLUE THAT RUNS ABSOLUTELY UNIFORM

The Nashville Manufacturers' Association has elected the following heers: P. L. Hoyt, president: E. S. Shannon, secretary. Charles M. Morford, retiring president, is also president of the Nashville Lumbermen's Club. Murray W. Hogan was elected general manager of the manufacturers' permanent exhibit. Lumber products are well represented in the manufacturers' building, and the exhibits have attracted wide attention.

Manufacturers throughout Tennessee are much concerned as to the workmen's compensation problem. Laws have been passed in a number of states, but do not meet with approval of employers in Tennessee. A commission of which W. R. Cole, Nashville, is chairman, and J. H. Turner, Nashville, secretary, has been appointed to make recommendations on this subject to the next legislature. The commission has started a series of hearings to be given in different parts of the state, and has invited both employers and employees to present their side of the question.

The Star Block Mills, of which Jasper Hooper is manager, which started in Nashville some months ago, has a rapidly growing business, manufacturing shuttle blocks of dogwood and persimmon.

---≺ LOUISVILLE ≻--

The Logisville Hardwood Club has been watching legislative matters at Frankfort closely, and has taken action on two important propositions One was the bill to abolish the State Forestry Commission, and incidentally to do away with the position of the state forester, J. E. Barton, who handles this work now, is an honorary member of the Hardwood ('lub, the club having realized that his work is along practical and effective lines. A resolution was adopted endorsing the work of the forester's office and protesting against the passage of the bill. reports indicate that it will be reported unfavorably by the committee which has had it in charge, the prompt and vigorous action of the lumbermen having had much to do with the result. The other matter was the Glenn bill, which is intended to increase the powers of the state insurance board, which now exercises supervision over and regulation of fire insurance rates. The bili proposes confiscation of the ratemaking machinery of the fire underwriters, and in other ways is so drastic that the withdrawal of the insurance companies from the state, in the event of the enactment of the bill into law, is regarded as certain. The Hardwood Club, after a consideration of the situation, went on record as being opposed to the bill, and has asked the senate of the legislature to defeat it. It has already passed the house. It is not known at this time whether the bill will go through or not.

The Churchill-Milton Lumber Company, the newest addition to the Louisville hardwood trade, has elected officers, John Churchill being made president and T. Smith Milton secretary and treasurer. Churchill is comparatively new in the business, having been with the Booker-Cecil Lumber Company as vice-president for the past year, while Mr. Milton is well and favorably known to the trade all over the country. He has been with a number of leading firms, retiring as sales manager of the Louisville Point Lumber Company to become connected with the new company, which is starting out under the most favorable auspices. The company has been elected to membership in the Louisville Hardwood Club and its members assigned to important committees by President Stuart R. Cecil.

That black walnut is coming into its own again is the opinion expressed by many leading lumbermen. Trade conditions abroad, as well as the fact that walnut is gradually being worked into a position of prominence as an interior finish, which means that more of it will be used for furniture manufacturing, make it seem desirable to members of the walnut trade to stimulate domestic consumption, and that this is going to happen is predicted by many of the leaders of the business.

Bids will be opened about April 1 on the new plant of the H. E. Heim berger Veneer & Lumber Company of New Albany, Ind. The new mill will be for the manufacture of both lumber and sawed veneers, the combination having become particularly popular in this territory of late The mill building will be of reinforced concrete foundations and corru gated iron walls. It is expected to have the plant in operation early in the summer.

Local lumbermen have received information to the effect that the Lebanon, Ky., Lumber Company is considering removing its sawmill to In case this is done the manufacture of beech flooring, which is being handled by the concern on a small scale at present, will be made a feature. The Glasgow Flooring Company, at Glasgow, Ky., is one of the few concerns specializing in the manufacture of beech for this purpose in Kentucky.

It is reported that Senate bill 279, which has been favorably reported to the Kentucky senate, was introduced at the instance of the Kentucky River Sawmill Association, an organization of hardwood lumber manufacturers which was formed for the purpose of eliminating the depreda-tions committed by alleged timber thieves. The bill referred to would regulate the taking up of logs from streams and would extend the time during which logs both branded and unbranded may be reclaimed from sixty to ninety days.

W. W. Dutfield of Harlan, Ky., a former army engineer, has organized a boy scout movement in that section, and the boys are being interested in the subject of forest protection. A forest protective association composed of timber operators has been started at Harlan, J. E. Barton, the state forester, baying arranged for the work to be carried on

Lexington, Ky., is getting to be something of a lumber center, two large companies having established their general offices there. They are the Turkev Foot Lumber Company a Ritter concern which is operating a big tract of timber in Jackson county, Ky. Its office will be on the ninth floor of the new Fayette National Bank building. It has also been announced that the Kentucky Lumber Company, of Cinclinati, wilf have its offices in Lexington after April 1. The company has mills at Burnside and Williamsourg, Ky.; Lafoliette, Tenn., and Suillgent, Als. Ralph Mctracken, secretary freasurer and sales manager, made the announcement in Lexington recently.

-----≺ ST. LOUIS >-----

The entertainment committee of the Lumbermen's Club of St. Louis is arranging for its next banquet and business meeting. This will probably take place the latter part of the month but it may have to be postponed until the early part of March, in order to meet the dates of some of the speakers who are desired. It is the intention at the present time, to have one of the leading St. Louis bankers address the club on the new federal banking system. There will also be some very important matters come before the club. The club is also planning to give a series of eitertaining monthly meetings during the next few months, and have a number of outside organizations as its guests. The plans are still in an embryotic state at present. The committee, however, is hard at work to perfect its plans.

E. W. Blumer, sales manager of the Lottiman Cypress Company, has been attending the recent convention of lumber associations in this section of the country. He was at the one in Chicago recently and also attended that at Kociuk, Iowa. He is now making several of the towns in southeastern Iowa and will be home shortly.

W. W. Dings of the Garetson-Greason Lumber Company has returned from a short trip through Texas and is getting ready for a run over to Kanda City. He says the railroad trade is in pretty good shape. The company's mills, with the exception of the one at Wesson, are running all right. The Wesson mill had to close down for several days, owing to the hard rains and wet weather. It was almost impossible to get logs from the woods on account of the rains so it was thought best to close down until the weather became more favorable.

J. A. Hemphill, sales manager of the Gideon-Anderson Lumber and Mercantile Company, states that the mills are working right along getting out lumber. He is looking for a brisk trade before long.

E. W. Luchrmann of the C. F. Luchrmann Hardwood Lumber Company says the company has been doing a very satisfactory business right along and is anticipating a tine trade as soon as the weather will permit of building operations to begin.

Frank G. Hanley of the Frank G. Hanley Cypress Company is taking advantage of the dullness in the cypress trade, to go to the Gulf with bis family. He will be back in time to go after the spring business.

Frank Liebke of the C. F. Liebke Hardwood Mill and Lumber Company states that the company is expecting a big shipment of ash logs before long. It booked a big order recently, one of a million feet of quartered and plain bak.

———≺ ARKANSAS >———

The Southwestern Lumber Company of Neal Springs, Ark., has filed resolution with the secretary of state to surrender its charter. This company has been engaged in the hardwood lumber manufacturing business at Neal Springs and Hope, Ark., for the past several years.

A contract for the purchase of 700,000 feet of white oak timber in Newton county, Arkansas, was recently let by Francis Kiefer, forest supervisor of the Ozark National Forest, to the Buffalo Stave and Lumber Company.

One of the largest timber deals to be transacted in the state recently was completed last week when the Chicago Mill & Lumber Company, of Helena, bought 98,000,000 feet of hardwood timber near Georgetown on the Missouri and North Arkansas railroad. This timber is located in the White river bottoms of Woodruff county, and covers about 20,000 acres.

The Red River Cottonwood Lumber Company, with plant at Clipper, fifteen miles north of Texarkana on the Iron Mountain railroad, was recently thrown into involuntary bankruptcy on petition of creditors.

The assets are listed at \$20,000 and the liabilities at the same figure.

Fred G. Hurbourn, thirty-six years old, died at a Little Rock hospital on February 9. Mr. Harbourn was a native of Illinois, but had resided in Arkansas for the past ten years, during which time he was engaged in the bardwood lumber business at Walco. He is survived by his wife, two sons, six brothers, four sisters and his father.

The Forked Leaf Oak Company's plant at Heber Springs began operations on January 12. This concern is manufacturing wagon and implement stock. E. H. Ewing, formerly of the E. H. Ewing Lumber Company of Heber Springs, is general manager of the company.

The Duff & Hetzler Company of Mountainview, Ark., manufacturer of tight barrel and circular heading, recently purchased 1,500,000 feet of white oak timber near Turkey Creek, Baxter county. The company is installing new machinery at its plant and will have it in operation by March 1. This company has operated a mill at Brinkley, Ark., for the past thirteen years.

On February 20, United States District Judge Jacob Trieber rendered a decision in the case of the United States vs. Lee Wilson & Co., commonly known as the Moon Lake case, in favor of the government. is one of the famous Arkansas sunk lands cases, which involve altogether the title to some 80,000 acres of timberland in eastern Arkansas. The Moon Lake case involves only about 900 acres of land, but the decision in this case is of far reaching effect on the numerous other similar cases. Litigation arose over the question as to whether or not this so-called sunk land belonged to the United States government or to individuals claiming under the state of Arkansas and the St. Francis levee district. It was the government's contention that through error of the surveyors in 1841 this land was returned as lakes and sunk land when in fact it was sand in place. The government contended that it was not the intention of Congress to part with this land and the title still remained in the United States government. In this contention the government was sustained by the ruling of District judge Jacob Trieber. The case will likely go on appeal to the Supreme Court of the United States before final determination.

==-≺ WISCONSIN ≻=

The new concern incorporated as the Mitchell Wagon Company of Racine has taken over the Mitchell wagon business from the Mitchell-Lewis Motor Company of Racine. The newly formed firm was incorporated with \$500,000 capital stock by Milton J. Knoblock, John B. Simmons, George N. Fratt, Raymond Weins and John B. Rowlands, for the purpose of manufacturing wagons and automobile bodies. It is thought, however, that the new firm is being financed by eastern capitalists and also rumored that the International Harvester Company of America is interested in the deal, that the plant will be one of five of the largest in the country to be consolidated and that Charles R. Flint of New York is financing the company. The wagon business was founded in 1838 and for many years the Mitchell & Lewis Company, Ltd., were leading factors in the wagon trade. The Mitchell Motor Company was later formed by the same interests to manufacture auto-In 1910 the two concerns consolidated as the Mitchell-Lewis Motor Company with \$10,000,000 capital stock. This company has now disposed of the wagon business and will manufacture motor cars ex-

Mills and Office, QUIGLEY, ARK. Postoffice and Telegraph Office, HETH, ABK. building, and engaged in jobbing hardwood and lumber in car lots. Mr. Kraus was formerly traveling salesman for the R. Connor Lumber Company and more recently sales manager of the Atwood Lumber and Manufacturing Company of Pack Falls where he remained until that business was taken over by the Hines Lumber Company.

The A. H. Stange Company of Merrill has moved into its new offices in the former Lincoln County Bank building. There are two stories and the basement devoted to offices of this concern.

The village of Crandon is the scene of great logging operations at thus time. Besides the annual output of 12,000,000 feet of hardwood by the local company, Keith & Hiles Lumber Company, Medee of Shawano is banking at Rocky Siding, a mile and a half from the city on the Pelican branch, 8,000,000 feet of hardwood besides several thousand cords of pulpwood; the Underwood Veneer Company has a large crew near the Pelican branch with a logging radiroad and a fifty-ton logging locomotive hauling to the branch; Morse and Tradewell of Antigo have built a logging radiroad to the branch and are rushing out thousands of feet daily; the Rhinekunder Veneer Company has a crew of thirty men loading logs on the Kvith & Hiles logging radiroad and numerous jobbers are cutting logs and pulpwood. On an average fifty cars londed with logs are sent out of Crandon to the main line daily. While the late coming of snow and cold weather retarded logging operations for a period the work is now going on with great activity.

The various camps of the Menasha Woodenware Company of Menasha, located in northern Wisconsin and Michigan, are working full crews now that the weather has turned favorable for logging operations. Long trains of logs are arriving daily at Menasha from the camps. Seventy men are working in the two Ashland camps and about half that number in the two Mosinee camps of the John Weeks Lumber Company of Stevens Point. Logs are being received in great numbers at the mill in this city. The Weeks company also has six contractors putting in logs at different places. The E. J. Pfiffner Company of Stevens Point also had a large crew logging in Ashland county. These logs, however, are manufactured at the mill of this concern located at Sell's Spur as during the past two seasons. The big sawmills at Antigo are now receiving logs faster than they can be cared for. The Faust Lumber Company of that city has commenced the season's cut, following the lead of the other mills.

Lumbering concerns in Marinette have been expanding and enlarging their scope in their lines of products during the past few months. The Michigan Hoop Company has installed five thousand dollars worth of new equipment in a new addition for the manufacture of trunk slats in addition to its regular line of hoops and staves. The big Kreiter Piano Company plant will increase its output to twenty-five pianos daily to meet the demand of outside companies who have their instruments manufactured here. The General Appliance Company on Main street has a large volume of business lined up for the coming season on a new product, a complete line of porto furniture.

Articles of incorporation of the La Pointe Lumber Company of Menomonic have been filed with the secretary of state. The capital stock is \$35,000 and the incorporators are G. W. La Pointe, M. Maulne and W. W. La Pointe.

The Phoenix Chair Company of Sheboygan has filed an amendment to its articles of incorporation thereby increasing its capital stock from \$300,000 to \$700,000.

An addition to the shops of C. Mattison & Sons, manufacturers of wood-working machinery, Beloit, is being crected on Fifth street. The construction will be of brick and of similar architecture as the present building. The addition provides for 1,300 square feet additional floor snace.

The largest dental furniture factory in the world, the American Cabinet Company of Two Rivers, is doing a rushing business. It employs 800 men and only recently secured additional help from the Milwaukee Free Employment Bureau, the labor supply in Two Rivers having run short. Its products are sent to every country in the world.

The Wisconsin Railroad Commission has granted a certificate of public convenience and necessity to the Minneapolis, Merrill & Marinette Railroad Company to build a line from Merrill to Athens, a distance of twenty-one miles. The road is located in the lumbering region and will undoubledly be used to a great extent in hauling logs and finished lumber.

The planing mill of the Arpin Hardwood Company at Atlanta was totally destroyed by fire on Sunday night, February S. The origin is not known and is somewhat of a mystery as there were no boilers on the plant, the steam being furnished to the engines from the boilers of the sawmill. The loss is estimated at \$35,000 and is covered by insurance.

The Wisconsin Railway Commission has made several rulings that are of interest to lumbering. Farm wagons, formerly in the first classification, were placed in the second, at a reduction of about twenty percent in the cost of shipment. The complaint was made by the Northwestern Wagon Company of Fort Atkinson on the North-Western line but the rates affect all lines. The commission denied the petition of the Oshkosh Fuel Company and the Wausau Advancement Association for an order to the Milwaukee road to reduce its rates on wood, lumber and boxes. The Omaha railroad was granted a certificate of public convenience and necessity for the construction of a ten-mile branch into the lumbering region, from Kaiser to Pauk Falls.

P. G. Var. manager of the senties Refrigerate (Company of Fond du Lac was the prime bender of a movement in the gathering of loss manufacturers by a printed circular, listing manufacturing plants and their products to be inclosed in every shipment of goods. The manufacturers decided to hold regular meetings and form a division of the Business Men's Association.

Word has been received at Osidesh that John A Spandding formedly president of the Wall Spandding Lumber Company of that city has been missing since December 6. Last year Mr. Spandding removed to Coeur de Alene, Ida., and early in December went to Oregon to inspect timber tracts. Since going into the woods he has not been heard from. Four weeks before disappearing Mr. Spandding was married.

Kemeter Brothers of Jefferson have started up their mill at that place and also that at Helenville. William Walther is again in charge of operations. The Kaukauna Lumber & Manufacturing Company of Kaukauna has also started its sawmill

The Hardwood Market

—≺ CHICAGO ≻—

The tone of the Chicago nearket for the past couple of weeks has not been entirely satisfactory. In fact, it has been rather disappointing, judging from the opinions expressed by a great many of the local trade. This does not mean, however, that pessimism reigns or in fact that there is anything but a hopeful spirit prevalent. It is a fact, however, that buyers are continuing to hold off; that their orders are neither of the desired size of thequeby.

It is highly probable that inclement weather conditions which have held up building operations, and in fact have practically stopped them for some little time, have had more to do with this situation than almost anything else, as there is no logical reason why the trade should not be brisk right now in the local market.

The yard trade is beginning to buy more than it has been, according to report, but this is because of anticipated sales which it is expected will materialize as soon as the weather shapes up enabling building operators to go ahead with their various work.

The call from the local factory trade is continuing on a fairly good basts, but is not entirely satisfactory either from the point of view of volume or frequency of call. However, the Chicago market has not broken any further, and it is firmly anticipated that prices will not strike any lower level than is now prevailing. This market can usually be counted upon for more or less of the unsatisfactory development as soon as there is any bestancy in the lumber business in general, as, like any other large market it is asked to absorb any quantities of stocks that cannot be moved easily through the usual channels.

However, considering low stocks at the factory and in the yards, there is every reason to believe that as soon as buying assumes even a normal condition any surplus of offerings will be easily absorbed without there being any breaking of prices.

Low grades are holding up better than almost anything else on account of continued activity on the part of the box manufacturers who are absorbing about all of this class of material that they can get.

Red gum does not show any great strides forward although sap gum is somewhat firmer. Oak is not changing materially, it being anticipated that these stocks will experience a gradual strengthening from now on. Weather conditions locally point to an early breaking up of winter weather, which will result in materially enlarging the call for all kinds of lumber in Chicago.

____< BUFFALO >-

The hardwood demand has improved this month and is on a considerably better scale than some weeks ago. More interest is shown in lumber purchases and the tendency is to make inquiry for larger blocks. Most yards report getting in a pretty fair amount of business this mouth and some stocks have been moving out almost as fast as they came in. Prices have been a little firmer for the past few weeks, and it is thought that the market will hold up well during the present year.

A variety of hardwoods are in demand, among them plain oak, maple, birch, chestnut and ash. The buying in these woods has been so small for some time that quite a large amount of stock has been needed to fill the requirements of the trade. There has been a steady demand for flooring recently, especially in oak and maple. These two woods promise to be about the leading hardwoods in this market for some time. Poplar is not active, but is about holding its own. All low grades are firm in price.

-----≺ NEW YORK >=

From comments heard in wholesale quarters the hardwood market is considerably improved, but to say the same for the whole thing would hardly be fair. There is unquestionably a big increase in inquiry and

orders are more in number and for larger quantities than last month. The advent of buyers in the wholesale market is due more perhaps to the condition of stocks on hand rather than to an improved trade in consuming channels. It is well known that stocks in yards and in man-facturers' bands are badly broken even where the quantity is fairly large, and this is no doubt responsible for the better wholesale market prevailing. This is not to say that the retail trade is not better than in the closing months of last year. There is a stronger feeling throughout the whole market and a firmer condition is bound to result from the present state of affairs. Prices continue firm with no changes to speak of. Beech, ash and oak are in good call at prices which allow fair margins. Gum continues slow and prices for this lumber are unsteady. The building lines are picking up and this must be followed by better demand for hardwoods.

=≺ PHILADELPHIA >=

There has been a tangible advance in the hardwood market during the last tortnight, with a daily growing optimism as to outlook. The opinion generally obtains that the worst is past and that a gradual betterment in trading may be looked for from now on. Buyers are realizing that stocks at the mill ends are none too heavy and are consequently placing orders to protect themselves in the near future. Although locally things are more or less quiet, there is evidence of a building boom in the large suburban towns to begin with the advent of propitious weather. The long desired improvements for a greater Philadelphia, there is every reason to believe now, will soon crystalize into a reality, as a special election has been called for March 31, to create a loan of \$12,900,000 as beginning towards the removal of grade crossings; extension of the belt line to the river front; erection of twelve new docks, etc.; building of an art gallery and museum on the new boulevard and constructing of subways and elevated roads to every corner of the city, all of which will mean work for thousands of artisans and mechanics, who, as they are the two-story dwellers and constitute the bulk of the population, will in turn be able to buy more freely and thus give an impetus to business and the trade generally. Taking the situation as a whole, the outlook in Philadelphia is luminous. Reports from the New England travelers testify to a brightening up in that field, with a strong optimistic feeling as to outlook. In the local market oak is reported steady; chestnut quiet, no change in poplar, maple, beech and birch holding their own.

=< BOSTON >=

No particular evidences have appeared in the last fortnight indicating any great change in the hardwood situation here. Some dealers report improvement over recent conditions while others affirm that any reported gain is imaginary. Deliveries have been slow and uncertain owing to the extreme weather of the past four weeks. This delay to business in general has not had an appreciable effect on prices, and in the minds of some, it is the indication of a "necessity-demand" in the near future on account of shortening of stocks in the consuming market. It is safe to say that this is a consistent view and one which widely prevails in this section among the dealers in hardwoods, as the comparatively heavy offerings by manufacturers by mail and visits have affected prices on only a few items, principally poplar and more especially in wide stock. Plain oak always has a wide range in this market on account of the many varieties offered, but the average prices are now equal to what they have been recently. Quartered oak is strong in price, but not in volume moving. Little may be said of beech, birch and maple conditions except to repeat that beech is unmistakably increasing in value, while there are a few reports on maple indicating a little tendency to a lower basis. With conditions admittedly somewhat adverse, the market as a whole shows confidence by the dealers and a general tendency toward holding strong.

The hardwood trade situation has not improved during the past two weeks; on the contrary, it may be said to have become less satisfactory, the prevalence of quiet in the trade being now generally admitted. Reports of large stocks in the yards of this country are reinforced with statements as to extensive accumulations and excessive offerings abroad, especially in the lower grades, with the range of prices sagging, if not actually weak. The first month of the year was productive of fairly satisfactory results, and agreeable expectations were being entertained by the hardwood men when they experienced a check in the demand and values rather suddenly slumped. From a feeling of comparative confidence the trade shifted somewhat precipitately to one of uncertainty, and at the present time the outlook is not at all reassuring. In all probability there is nothing really wrong about business, but lumbermen nevertheless are disposed to go slow. To this hesitancy has been added a heavy snow fall and cold weather, which to a certain extent curtails the movement, interfering also with operations at the mills. Of course, salesmen are being sent out and efforts made to keep up to the record of January in point of volume, but this is decidedly more difficult than it promised to be not so long ago. Reports as to the supply are rather conflicting, some of the manufacturers stating that the offerings are heavier than is conducive to fair returns, while others assert that they could ship more lumber if it were in proper shape. The winter has been bad for drying, and as a consequence manufacturers are rather

behind in their deliveres, having the number on sticks, but being compelled to wait until it is properly seasoned. As far as prices are concerned, the entire list appears to be off, including even some of the better grades of oak, which for a time resisted all bearish efforts. To be sure, the recession in these grades does not amount to much, but the effect upon the rest of the list is by no means favorable.

The lower grades are being offered at figures which at times of an active movement would be considered attractive to the buyers, but which now fail to stimulate the demand to any extent. Sound wormy chestnut is still heavy, with the returns decidedly unsatisfactory, and with the inquiry halting, and this applies to a certain degree to oak, though the latter wood is showing up better. Low grades of poplar are in very liberal supply, with the buyers indifferent and the quotations down to very moderate figures. The wide poplar stocks are moving hardly at all, with values unsettled. Ash and other woods are about holding their own, though maple flooring appears to share in the weakness of the market As for the export trade, it is in a state of quiescence, with the shipments so heavy or rather the inquiry so limited that prices are unsettled, and shippers who forward stocks on consignment exposed to great danger of making serious losses. The markets of the United Kingdom and some of those on the Continent are overloaded with oak and poplar, and great care must be exercised in making shipments.

===≺ COLUMBUS ≻=

Improvement is reported in the hardwood trade during the past fortnight. There is a better demand for all grades and varieties from dealers who are inclined to stock up in anticipation of better business as soon as spring arrives. Factories are also buying steadily and the tone of the market is satisfactory in every way. Prospects for the future appear to be brighter.

Prices have been pretty generally maintained at the levels which the prevailed for some time. Cutting is reported only in a few cases, the tendency among jobbers and manufacturers being to uphold quotations. In fact the feeling all along the line is firmer and no attempt is being made to move stocks at the expeuse of the price list.

Shipments are coming out promptly, as the car supply is adequate for all needs. Dry stocks in the hands of mill owners are not large and this is taken as a good indication for price strength. Stocks in the hands of retailers are larger than formerly but they are comparatively small. Dealers are not inclined to stock up to any great extent at this time. Factories making implements and vehicles are the best customers from those manufacturing industries. Furniture concerns are expected to be in the market soon as their shows were fairly successful.

Quartered oak is in good demand and prices for all grades are firm. There is also a good demand for plain oak, both red and white. Chestnut is another strong point in the market and all grades are moving fairly well. Sound wormy is the strongest grade. Poplar is gaining in strength and stocks are not as heavy as formerly. Basswood and ash are also selling fairly well for the time of the year. Other hardwoods are unchanged.

----≺ CINCINNATI ≻=

While all reports as to the progress of the hardwood market show a general improvement, it is more in prospects than in actual business booked. Dealers are receiving many inquiries covering nearly every item on the list and reports from consuming centers are most assuring. Many factories that have been doing very little during the last few weeks are showing signs of general resumption and those who are in touch with the situation claim that there will be plenty of business before very long. It is the general opinion that business for some time to come will be done on a small order basis as has been the custom of late and this will likely continue although a much greater frequency of orders is expected. Much is expected from the furniture trade this stock is encouraging, and when these plants are well supplied with stock is encouraging, and when these plants begin cutting up their regular amount of lumber there will be a very much improved demand for many of the hardwoods.

Just at this time there is a very good demand for all grades of plain oak, and quartered is doing very well. Ash is a very good seller, thick stock being preferred. Chestnut has improved some, but it is the low grades that are in best demand. All low grades are in very good request, the box factories being quite busy and taking all offerings of stock suitable for their requirements at reasonable prices. Manufacturers of hardwoods have good sized stocks on band at mill points but they are not overstocked by any means and most of them are not accepting business very far ahead but are asking for shipping orders for what is being bought. They hold a very optimistic view of the situation, and prices are held firm on all items.

-----≺ MEMPHIS >-----

The demand for hardwood lumber here continues to improve. Some of the leading manufacturers and dealers say that the furniture interests are beginning to take stock more freely and that the large gain in inquiries from that source is indicative of a decided increase in business in the near future. It is pointed out that, following the furniture exhibits, manufacturers of furniture held out of the market in the belief

Mahogany and Circassian Lumber & Veneers

¶ The largest assortment of finest figured Mahogany Logs, Lumber and Veneers in the country can be found at the Chicago plant of C. L. Willey.

We are just in receipt of fifteen cars of remarkably superior Circassian Walnut Logs, large size, well-figured and of good color, which are now being cut into Veneers.

¶ A visit or correspondence from discriminating buyers of all varieties of fine Imported and Domestic Cabinet Woods in Lumber and Veneer is solicited.

¶ You will not only find the Willey ware-houses well stocked with a superb collection of Circassian, Mahogany, Vermilion, Black Walnut and other fancy foreign and domestic lumber and veneers, but buyers are assured of prompt and painstaking service, and a quality of product not usually obtainable.

¶ To visit the plant take Blue Island Ave. car at the postoffice to Robey Street.

*Indicates stock dry enough to ship within 60 days; remainder of items ready for immediate shipment. The item of Core Stock is a special grade, suitable for veneering over. This is thoroughly dry and we are prepared to quote an attractive price.

All Red and Sap Gum in grades of No. I Common and Better is Kraetzer-Cured, insuring the lumber to remain straight and tlat and to be absolutely free from stain. Kraetzer-Cured Lumber is of a soft, mild texture and uniform color.

We have facilities for kiln-drying and surfacing.

VIEW OF MILL SKIDWAY, WITH PART OF LOGS STORED IN BACKGROUND-WE HAVE 6,000,000 FEET OF SELECTED HARDWOOD LOGS STORED ON OUR MILL YARD.

that they would be able to forv more cheaply About this time their were some pretty large lots or oak offered at concessions by a prominent firm which needed ready money and this encouraged them in that attirude More recently, however, they have found a lack of offerings at a lower level and they are beginning now to buy at the prevailing price This applies with more emphasis to plain and quartered oak and sap-gum than to anything else. In the meanting the lower grades of cottonwood and gum are in active demand at hardening prices. The box manufacturers are doing a large business and they are asking higher prices for their output because of the large demand therefor and because of the growing scarcity of both cottonwood and gum in the lower grades. The upper grades of cottonwood are in but moderate request while red gum continues to move in only a small way. There is demand enough to take all the ash offered and prices are well maintained Cypress sells well in shops but the other grades are slow as to move ment and rather heavy as to prices, especially in stock thicker than one inch. There has been no material improvement in export business. and exporters here are inclined to the belief that the demand from that source may continue rather slow for a while. The feeling of optimism in other lines of activity is apparent among lumber interests and they face the future in the confident belief that there will be a much better volume of business by the end of the first quarter of 1914.

Practically all the mills at Memphis and in the immediate Memphis territory are being operated at full capacity. There are some exceptions to this general rule but they are few and unimportant as affecting the total output. There has been some improvement in the demand for hardwood lumber since the first of the year and the outlook is for still further gain as the spring trade opens. The furniture manufacturers are beginning to enter the market and the box makers are already doing a large business, with the result that their needs are quite full. Stocks in the hands of consuming and distributing interests are reported small as a general proposition and this fact, together with the expectation of a more active demand in the near future, is proving quite a stimulus to production. Manufacturers believe that there will be a good business and that prices will be profutable, and they are showing a distinct disposition to get their stock lists in satisfactory shape against the better business they regard as in prespect.

The box manufacturers here are doing an excellent business and are able to dispose of their output at profitable prices, though in some instances values are not as high as they were a year ago. Egg cases are in excellent demand while there is likewise a general call for standard shipping packages. One firm here said the other day that its shipments for December were the largest on record, while the same firm reported that its deliveries Juning January were the largest ever shown for that particular month. There is a threatened scarcity of low grade cottonwood and gum, because of the conditions referred to elsewhere in this issue of Hardwood Records, and box manufacturers believe that a hardening market is probable on both the raw material and the products manufactured therefrom

-----≺ NASHVILLE **>**=

Business in the Nasnville hardwood market has been showing signs of gradual improvement during February, and by the arrival of spring shippers and manufacturers are looking for healthy trade. One feature of interest is the large number of inquiries being received, indicating that many buyers are watching the situation, and anxious to keep in touch with what they can do in the matter of prices. There is a fail demand in the local market, with oak the best seller. Some grades of poplar are moving, and there is a scattering demand for other lines. Some important business is mentioned in oak flooring. The box business is quiet. Much improvement is predicted in local building, when the weather becomes more satisfactory for outside work.

——— ≺ ST. LOUIS >-----

Little change has been noted in the local hardwood market during the past few days. There is a steady movement of plain sawed white oak, and prices obtained are quite good. There is only a moderate demand for quartered red and white oak but the cull for choice red gum and white popular is increasing. While there is a quietness reported for ash and cottonwood, many inquiries are coming in for these two items. This undoubtedly indicates that stocks are very low and that there will soon be an active demand for both. On nearly all items on the list prices are stationary, although plain white oak is commanding a slightly better price than it did a week or two ago. Cypress conditions are improving and high-grade stock is stiffening considerably in price. Salesmen who are covering the northern territory are sending in increased orders and it is the consensus of opinion that with the coming of pleasant weather there will be a good steady demand at advanced prices.

==≺ LOUISVILLE >=

While it is generally conceded that trade during the past two months has not seen of satisfactory volume, there is no diminution in the chearbliness which has marked the sentiment of hardwood men since the opening of the year. "There is more optimism and less business in evidence at present," exclaimed a hardwood man recently, "than I ever saw before." The optimism is based on lock, however, and not merely on

a desire for good business, and consequently seems to be in order. For one thing, the fact that big business has ceased to fear untoward developments in the policy of the national administration is making for general confidence. For another, the winter wheat crop appears to be safe, and a good foundation for carly season business is therefore laid. The furniture shows, it is true, did not produce as much business as usual, but this is being rapidly made up for by post-exhibition orders. The manufacturers are really getting tired of so many furniture shows, and the unsatisfactory results are rather welcomed as showing the need for a change in the method of bandling the business. January hardwood trade in this market was a good deal less than was handled in the big month of January, 1913, of course, but Fébruary has been pretty close to normal. March is expected to show considerable life, and if demand does not become much more active next month, the lumbermen will miss their predictions.

=≺ MILWAUKEE >====

Wholesale lumbermen met with a decided increase in business last week, as a result of the liberal orders placed by dealers who were in the city to attend the annual convention of the Wisconsin Retail Lumber Dealers' Association. There was an optimistic feeling among the dealers present, which was reflected in the manner in which orders were placed for spring stocks. The general impression was conveyed that stocks in most retail yards are light and that it will be necessary for dealers to order rather freely if they expect to be in readiness for the spring trade. Wholesalers have been impressing upon dealers the fact that there is no better time to order than at the present, before stocks are decreased further and before prices advance. Local manufacturing concerns are taking more interest in the market and are making good inquiries, but the sash and door, interior woodwork and other factories are not buying as freely as jobbers would like to see them. There is still a tendency on the part of the factory trade to buy only enough to meet present requirements. Stocks on hand at most of these concerns are light, however, and it is only a matter of time before a better business will be secured from this source.

Hardwood prices are holding firm and there is an upward tendency in most northern lines, especially in birch and maple. The general impression is that there will be a shortage of available dry stocks before the spring rush is over with and this is a strong factor in keeping up prices. It seems to be making its influence felt, even on southern hardwoods. Low-grade hardwoods are in better demand, as the result of more activity on the part of local box manufacturers.

A decided decrease in the cut of northern hardwood is anticipated this season, due to the late arrival of winter weather. There has been plenty of cold weather and snow all over the northern lumber country since the first of February, and jobbers and lumbermen have been giving their entire attention to the work of getting their logs to the sidings, while hauling conditions are favorable. Logging camps were opened earlier than usual last fall, but logs piled up when winter weather failed to arrive and cutting has been suspended in many localities. Stocks were rather badly reduced during the past season and it was anticipated that the log output would be large and it undoubtedly would have been larger than in several years had the weather conditions been favorable.

February, up to the present time, has shown a remarkable increase in the building activity in Milwaukee. Up to the middle of the month there had been issued 56 permits for the erection of buildings to cost \$155,177, as compared with 31 permits for structures costing only \$42,760 during the corresponding period in 1913.

—≺LIVERPOOL≻—

The market for hardwood lumber has been exceedingly quiet and seldom have legitimate dealers here experienced such bad times. Prices ruling for stock are lower than they can profitably be imported at. Consignment shipments still continue very heavy and as one wit put it "we can only assume that shippers have not lost all their money yet." It would seem, however, to outside observers that some shippers were trying their best to pour some of their superfluous cash into the melting pot. Hickory has been the worst spot. A shipment of 2,000 logs was recently brought in. closely followed by another shipment of over 800 logs. Could anything be more foolish? Where is the buyer who is going to handle 2,000 logs in one line? If the shipments had been spread over the season the market could have swallowed the amount with ease, but tactics of this kind frighten buyers away. How can dealers here be expected to make contracts at profitable prices to shippers when there is the danger that big consignment shipments will compete with their stock at pence below the proper price.

The mahogany position is also weak. There have never been so many logs on the Liverpool quays as there have been during the past fortnight. Judging from the reported demand and the existed supply at recent sales mahogany values cannot be expected to keep on the present level, and general opinion among keen observers here seems to favor a considerable reduction. Round ash is one of the firmest spots, though here again dealers are threatened with heavy consignment shipments which would soon knock the bottom out of the market. Quartered oak is one of the firmest markets. Shipments of rock elm would also be favorably received. Wagon oak is very weak.

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS. VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

Custom Mill Work, Storage, Inspection

Foreign Fancy Woods, Mahogany, Cedar, Circassian

We receive the logs, store or warehouse them, manufacture them into lumber, cut or saw veneers, pile and store the product, and ship via any railroad. Also furnish inspection returns on logs or lumber. Can furnish accommodations and economies which it is impossible to secure elsewhere. We always have on our yards parcels of plain and figured African, Mexican and Cuban Mahogany, Circassian Walnut and Cedar logs, placed here for sale by direct foreign shippers, from which advantageous purchases can be made.

A Fine Opportunity to Dispose of Narrow, Short and Low Grade Oak

To the oak lumber manufacturer who accumulates considerable oak lumber that can not be sold unless they put a price on it that is so low that there's no money in it, there is now offered a fine opportunity to dis-

pose of this lumber by making it up into oak flooring squares like the illustration.

These squares are jointed together without

Linderman Automatic Jointer Gluer, Clamper and Sizer

squared to the exact width. A straight tongue and groove is then cut on the two sides and ends.

squared to the exact width. A straight tongue and groove is then cut on the two sides and ends. The demand for these flooring squares is greatly in excess of the present output. Still there are several Southern manufacturers making these flooring squares.

One New York firm wants a good many car loads of the Linderman Flooring Squares. The prices it offers will net you, delivered New York City, practically as much as you are getting from the better grade of oak lumber.

Write today for further information and we will give you the details of the market, manufacturing costs, etc. You're not obligated in any way in asking for particulars, yet it might be of value and worth your consideration.

WE continue cutting Hardwoods and Hemlock out of big, smooth, clean, prime logs, and we give special attention to the making of stock that is hard to make and is required in heavy thicknesses and special widths and lengths. We are in shape now to cut Poplar, in any widths or thicknesses desired. Also are getting into the mill a fine lot of Chestnut logs that can be cut to order. A little later on will be glad to talk Southern Mountain Maple with you—IT IS SURE FINE. Also Hemlock in all widths and all grades.

OUR DOUBLE BAND MILL-HUTTIG, ARK.

Why We Can Give "Value Received"

We own one hundred thousand acres of the best virgin Southern Hardwood timber.

We operate large band mills at Huttig, Ark., and Deering, Mo.

We cut FORTY MILLION feet of hardwoods annually and carry 15,000,000 feet IN STOCK.

We sell only stock cut on our own mills and so can GUAR-ANTEE the quality of EVERY shipment.

We ship high grades that increase the size and percentage of your cuttings, reduce factory costs and shrink the waste pile. Therefore:

We can SAVE YOU MONEY on every shipment of oak, ash, gum, elm, cypress, tupelo, hickory, cottonwood, sycamore, soft maple and dimension.

LET US PROVE THIS ON YOUR NEXT ORDER

Wisconsin Lumber Company Harvester Bldg. CHICAGO

A floor to adore

For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "unequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced of modern methods and the advanced behave statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free.

What Veneer and Panel Consumers Will Use in 1914

This information is shown completely in our new correction pamphlet (off the press this week), which revises our veneer and panel consumers' requirements lists complete according to 1914 requirements. The information contained is all first hand and guaranteed to be authentic. It gives all details that you want to know on which to base an intelligent quotation.

It would cost you thousands of dollars and years of work to compile the same information—we know because that is what it cost us. You can have it for 1% of its real cost.

As its best use is while it is fresh and it costs only two cents to write, drop us a line today and let us

give you the details.

Are You a Kicker?

Louisville is such a good place to buy hardwood lumber that it is said by many that kicks and kickers are unknown there. The reason, of course, is that everybody gets a square deal and one hundred cents' worth of value for every dollar expended. If you think you have a reputation as a kicker come to Louisville and be reformed!

If the members of the Louisville trade had been the penny-pinching, technicality-seeking kind, kickers would doubtless be plentiful. On the other hand, the basis for the dealings of Louisville houses is service, and service consists of making satisfied customers. Our belief is that it pays to devote as much thought and energy to pleasing our present customers as it does to getting after new ones.

Perhaps you have never tried putting your lumber problems up to lumbermen qualified to handle them for you. Part of our service consists in telling you the best kind of stock for a given purpose. It is just possible that we can show you how to save money and at the same time get just as good results as at present.

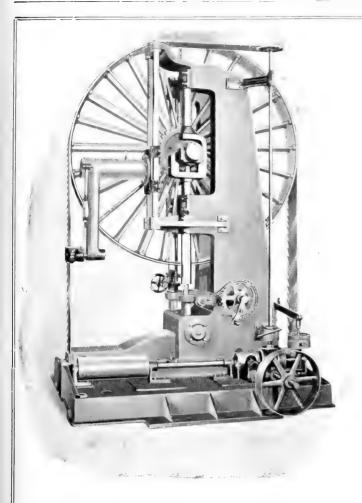

Factory men requiring a wide variety of stock are urged to consider the fact that Louisville houses carry perhaps the greatest assortment of hardwoods in the country, so that orders for mixed cars, consisting of a large number of items, can be readily filled. Send us your inquiries.

Newest Hoosier Band Saw Mill

We have been building band mills for thirtyfive years and this New Hoosier Band Saw Mill represents the experience of these years.

The simplest mill in construction and the easiest kept in order.

We build this mill in three sizes, 6, 7 and 8 ft. The widest saw the 6 ft. mill will carry is 10"; the 7 and 8 ft. mills will carry 10, 11 or 12" saws. This mill is built in a substantial manner and embodies all that is latest and best in Band Mill design. The base is of the heavy extension pattern and is so constructed

that it does not overhang the foundation but extends completely around the mill. By means of the construction of the column the upper wheel runs in the center of the mill and is supported both above and below the mandrel. The bearings are long and are chain oiling.

The tension device has roller bearings and is very sensitive and durable. The upper guide is raised and lowered by power and is nonbreakable. The lower guide is so arranged that it can be opened quickly. The roll back of the saw is power driven.

The 6 ft. mill will split a 48" log and lay down a 30" board between saw and column; the 7 ft. will split a 54" log and lay down a 36" board, the 8 ft. will split a 57" log and lay down a 42" board.

Review and Outlook

NEW YOU

General Market Conditions

TWO FACTORS HAVE SERIOUSLY MILITATED against favorable developments in connection with the lumber business in general. One is the continued hesitancy of the railroads on account of the postponement of the requested five per cent increase, and the other is the horrible weather conditions which have prevailed all over the country for several weeks past. This inclement weather has been felt by business in general and naturally the lumber business has been one of the most serious sufferers. Factories have been shut down, building construction suspended, shipments tied up and the general trade has been pretty much demoralized. In fact, considering the peculiar winter which we have passed through, and its persistent following along into the spring months, it is no wonder that the lumber trade has not been as brisk as had been expected.

The business situation in general is maintaining about the same status that has been in evidence for some little time. There is gradually developing a strengthening of confidence in all lines, with, however, continued tightness in the money situation. The result has been slow collections. In fact, one big concern in Chicago says that up to a couple of weeks ago bankers have been compelling it to pay seven per cent, and have only come down to a more favorable level within that period. The railroads have also been mighty slow pay. This, of course, has had its own effect on business conditions, but as suggested, the most serious factors have been the continued absence of the railroads from the buying field, and the very serious weather conditions.

As to the first of these factors there is very little hope for any material change for some months to come. The discussion as it has developed at Washington has brought out factors which make it uncertain which way the Interstate Commerce Commission's decision will go, and it is a certain thing that the railroads will not become active buyers until the question is decided one way or the other. Therefore, it remains to be seen whether they have been basing their claims on false statements or not.

As to the second factor. It is reasonable to suppose that a more favorable condition as to weather will make itself felt within a short time. The result of this will be an opening up of building construction, resumption of normal transportation conditions, further activity on the part of the factory trade, and a generally more favorable tone in the business situation. The lumber business of course is one of the first to feel the results of bad weather, and such effect upon that business is probably more serious than in any other line.

There is very little change so far noted in the export situation, although reports from abroad indicate that on account of curtailment in shipments of late, in some cases this curtailment having affected seventy-five per cent of the normal shipments, the stocks generally abroad are being somewhat cut down. This, of course, does not hold good in all cases, but is probably true on a general basis. The promise is that on account of this curtailment the situation will shortly improve, and normal shipments, with a fair level of prices, will prevail.

In the Liverpool market there is a continued over-plus of stocks on hand, and the consignment shipments are continually in evidence with their usual serious results, but on the whole a more favorable indication can be expected from abroad within a reasonable period.

Up to a short time ago northern operators in hardwoods had practically given up hopes of getting out any kind of a normal production this year on account of absolute absence of possible logging conditions. In fact, it was predicted that in some cases the production would be cut down to twenty-five per cent of normal. However, during the last month-and-a-half the condition has very materially changed, and with excellent logging conditions, a very fair quantity of logs has been gotten in. Wood crews have been sent back into the woods and all operations are being pushed to the utmost, and the result will be that while stocks will be considerably below normal, there will be a good quantity of northern hardwoods gotten out. As a proof of the fact that the situation as regards northern hardwoods will be strong this year, many of the northern mill owners have already sold out their entire cuts.

With the rather less desirable condition prevailing in connection with the southern hardwoods, this northern situation can be viewed with satisfaction. The conditions will probably dovetail into each other with the favorable result to the hardwood trade in general.

Reports from the Memphis territory indicate that logging conditions are excellent for the most part there, and that there will be a good run in mills around Memphis and the Delta territory. However, there has been no report of any great over-plus of southern stocks as yet, or at least there is no indication that there is any over-plus, which will have a tendency to result in the general breaking of the market. Of course, this does not mean that there has not been price-cutting, but these have as a general thing resulted from accumulations on the part of concerns who were desirous of turning over their stocks quickly, being in need of immediate funds. These cases, however, are isolated, but have had their effect upon the average market. As a general thing, large stocks continue to be held by strong concerns who continue to refuse offers below what they think the items are worth

There has been a very apparent increase in the inquiry all over the country for all items of hardwoods. This does not mean that actual buying his increased, but indicates that the buyers have come to realize that there is a probability of prices going up materially in the near future, and they are using this means of feeling out the

trade to find out exactly just what the situation is and what the prospects are for the immediate future.

As stated before, responsible producers have refused orders for large lots for future shipments, and this feeling out is probably to determine whether these refusals will continue. It, however, is a good indication and unquestionably predicts that buyers realize the necessity of stocking up in the near future. If this were not so, they certainly would not take the trouble to even feel out the market.

An illustration of the present trend of buying is seen in the case of a large veneer concern which maintains a constant stock, adequate to meet all orders for immediate shipment that might come in. It is not the usual policy as prevails in the veneer business, and this concern has made a specialty of orders of this kind. It keeps an enormous stock of veneers in its warehouses, and states that while the veneer business in general has not been in any too good condition for some little time, its business has been maintained on a better level during the easing up of the general veneer situation of late than it has ever attained before, which of course, is conclusive proof that the majority of the orders for veneer stock have been for imme diate shipment and of a moderate size.

Generally speaking, continued optimism reigns in all lines, and there is certainly every indication that the return of spring weather, accompanied by the opening up of building and other operations, will see the situation shaping up into a much more favorable condition.

The Cover Picture

A FREAK OF THE FOREST forms the central figure of the cover picture which illustrates this issue of HARDWOOD RECORD. Two venerable trees, a sycamore and a red oak stand side by side, and one of the oak's large limbs is firmly grafted into the body of the sycamore. The limb which joins the two trees has sent out no branches, but apparently it is wholly oak, and receives no sap from the sycamore. The photograph was recently made on Lick Creek, Madison County, Indiana, by Huron H. Smith, of the Field Museum of Natural History, Chicago.

The two trees are vigorous and seem good for a century more, at least, if left to the course of nature. It may be observed that the two trees lean away from each other. That is not due to an accident, but illustrates a law of vegetable growth, that plants will incline toward the light. The shade of each tree repelled the other. It is a force which has been acting since the trees were seedlings, as is evidenced by the regular angle which measures their separation. Had they grown in a forest so dense that there was no more light on one side than on the other, the chances are that they would have grown side by side, with no tendency to lean away from each other.

The process by which the oak limb became grafted into the sycamore's trunk is a matter for speculation. It is doubtful if it is a true graft, with an exchange of sap between the two trees; but probably resulted in another way. Perhaps the oak limb, when both trees were small, lay across the sycamore's trunk and the wood gradually grew over it and cut off the circulation of sap beyond, causing death to that portion.

The remarkable thing is that the stub of the oak limb should remain alive so long after wholly deprived of its leaves. Usually, if a limb is cut off some distance from the trunk, and no sprouts come out, the stub will die. That is because no sap can circulate through it. Leaves stimulate, if they do not wholly cause, the movement of sap. Deprive a tree of its leaves, as when caterpillars defoliate it, and it will surely die, if the defoliation is repeated a few times.

The stub of the limb connecting the two trees in the picture has had no leaves for many years, yet it is alive and apparently it has grown about the same as other portions of the tree which have retained their leaves. The tree food (sap sent down from the leaves) which has caused the stub's growth, evidently has made its way into the stub from the trunk of the oak. It has gone upward from the trunk into the stub, which is contrary to the usual movement which is from the leaves downward through the twigs and along the limbs to the trunk.

Be that as it may, the living limb connecting the two trees of different species, is something more than a curiosity. It involves, if it does not controvert, some of the commonly-accepted principles of plant growth.

Outlook for Veneers

I NQUIRIES sent out the first of the year by Hamdwood Record have brought replies from hundreds of prominent users of veneers in this country, as to how their demands for stock this year will compare with last. The replies have been tabulated and analyzed. Taken as a whole their tone is decidedly one of encouragement. Most of the manufacturers expect to use more veneer stock the coming year than in the year recently closed. The indicated increase is not large in every instance, but the tendency is upward and there is general hopefulness. The woods which show the largest increase in requirements are oak, mahogany, basswood, red gum, Circassion walnut, birch, and chestnut. Increase in a smaller degree is indicated for yellow poplar, black walnut, ash, and maple.

It is the tendency rather than the actual increase that is the chief encouraging feature. "Faith without works is dead" holds as true in the veneer business as anywhere else. The users not only have faith that business will be better, but they convert their faith into the works by preparing to do more business. A mere desire for better things will not necessarily amount to anything, since the desire is ever present; but expectation is a positive force in causing things to happen, and the users of veneers unquestionably have the requisite expectation at this time.

Example of Overproduction

THE ANNOUNCEMENT IS MADE that the lumber cut in Washington and Oregon in 1913 aggregated 7,760,000,000 feet board measure. This is an estimate based on statistics of the logs cut last year in those states, returns for which have been compiled. The statistics were collected by the state foresters of Washington and Oregon, coöperating with H. B. Oakleaf of the United States Forest Service. It is not apparent that the government has authorized any report concerning the Iumber cut in those states in 1913; but the above figures have been published by the West Coast Lumberman, at Seattle, and it is assumed that they are approximately correct.

The cut of lumber in the two states in 1912 was 6,016,000,000. The 1913 cut is twenty-eight per cent larger. This does not look much like curtailment of output, about which there has been so much talk. It does not resemble a halt in production until the markets can work off accumulated supplies, thereby permitting prices to recover. It is well known that there are sawmills enough in the country, and timber enough, to increase the lumber cut to proportions larger than any past year has shown, not excepting the banner year of 1907; but the business judgment of lumbermen generally has been that it would simply demoralize the market to overload it, and that loss and hard times would follow.

The Pacific coast lumbermen do not seem to fear overproduction, if their sentiments may be deduced from their actions. They do not expect to use any great quantity of their lumber at home, but count on selling it east of the Rocky Mountains and in foreign countries. It doubtless suits them very well when eastern mills hold down production; for it affords a chance to run western lumber in. There are some people, however, who may question the correctness of the ethics of the western lumbermen who increase their cut while the millmen in the East and South act on the theory that the good of all will be conserved by holding down the output until business conditions improve.

It looks as if the eastern and southern lumbermen have been left "holding the sack" for the western "snipe-hunters."

Apparently an Opportunity

THE GENERAL MANAGER of a big southern corporation which turns out a great deal of gum recently made the observation that, in his opinion, it would pay gum manufacturers to organize

a remanufacturing plant of their own, which weald not only guarantee gum trim being put in first-class shape, but would eliminate the possibility of unfair prices being asked for this class of commodity. This man said that he had recently been talking with the head of a Chicago concern which makes a basiness of contracting for the furnishing of the material for interior finish. The lumber man said he had asked the interior finish man why he did not devote some attention to gum. The reply was that there was no apparent logic in doing so when he could give satisfaction with other woods at much lower prices.

He stated that in Chicago he would have to pay in the neighborhood of about \$80 for red gum trim, whereas he could secure other satisfactory woods for Euch better figures. The lumberman made the observation that there is a vast difference between this \$80 and the approximate figure of \$28 which would be realized by the lumberman for the material which he furnished to the trim manufacturer.

The first suggestion, however, is the most desirable one, and it really seems that the idea is excellent, although, of course, there will be wrinkles which would have to be ironed out before it could be put to practical application. The purpose of such a factory should not be to disrupt the market and to enter into any unfair competition with already well established interior finish plants, but would be, on the other hand, as suggested, merely that the advocates and manufacturers of red gum should have a dependable medium through which to market their wood to the consuming trade, and be absolutely assured of perfect attention. The prime object would be a sort of advertising proposition for red gum. That is, by insuring a perfect product and perfect installment and care, the real possibilities of the wood would be more adequately brought out.

Of course, such an organization could not attempt to arbitrarily undersell the goods of old, established concerns, for obvious reasons. Nevertheless, there is no reason why such a plant could not be made a paying proposition, purely from a direct business standpoint. In addition, its direct value to gum manufacturers should be very considerable.

In Lieu of the Five Per Cent Increase

A PROMINENT HARDWOOD MAN has made a suggestion in connection with the argument, pro and con, regarding the proposed five per cent increase in general freight rates. He suggests that the railroads can better recoup their losses, if they are sustaining losses, or can increase their revenue by earning that increase through a limited time service, charging ten per cent bonus over established rates on a regular form schedule for freight service. For instance: He says that if a railroad will guarantee to deliver a car on an unloading track at Detroit or Chicago in six days or less from Cincinnati, it would earn this bonus, and that in case of failure to do so only the present rate would be assessed.

This lumberman avers that two-thirds of the shipments could be sent on this quick-service plan, and that the returns to the railroads would more than compensate for any shortage in rates which they might reasonably claim.

It is, of course, impossible to state whether or not the idea is based on sound and substantial facts, and whether it would actually work out in practice. It is unquestionably a fact, however, that an express freight service for all freight shipments would be welcome and would actually be used a great deal if it could be maintained on an efficient basis. It is a question as to whether or not shippers would be willing to pay as high a bonus as ten per cent, except in unusual cases.

HARDWOOD RECORD does not suggest that this matter be gone into thoroughly in connection with the discussion of the proposed increase, but merely presents the idea as an offering from one of its subscribers.

One Line of Development in the South

O N VARIOUS OCCASIONS HARDWOOD RECORD has observed that it would be entirely logical for woodworking plants to establish themselves in various parts of the southern hardwood producing territory. HARDWOOD RECORD has argued that there is no logical reason for shipping the products of the forests north in raw state under the heavy freight rate, remanufacturing them into various lines of finished articles and paying an additional freight item to get them back into the rapidly developing southern market again, It has called attention to this particular circumstance in connection with the manufacture of mahogany into various lines of high grade furniture, and the possibilities for such manufacture in New Orleans and other southern sections.

It has been particularly gratifying to note the rapidity with which this condition is developing throughout the entire South. Practically every week there is a notice of the incorporation of some kind of woodworking factory in the heart of some big hardwood producing center in some southern state. Thus it would seem that the proposition is working out to an entirely logical conclusion.

The woodworking man has come to the conclusion that he could not profitably import his raw material, remanufacture it and ship it south again on a basis that would be entirely satisfactory. He has further realized the rapidly developing possibilities in the developing markets of the South itself, and the chances for establishing a satisfactory trade direct through removing his operations, or reestablishing himself in some prominent center in the Southland.

These new enterprises cover all sorts of endeavors under the general woodworking head, and give conclusive proof that the woodworkers are alive to their opportunities and that the southern market as it exists today is offering some unusually good opportunities in the way of developing trade.

Wood's Place in Building

8 A BUILDING MATERIAL wood has a place which no sub-A stitute can fill as well. No one claims that for all kinds of buildings wood is the best, nor that it is suitable for all structures; but there are many places which nothing else can fill so well as wood.

The Chicago Record Herald of March 1 contained a long article in which wood was unfairly knocked. The article's tone, argument and conclusion indicate that it was written in the interest of brick manufacturers. Prospective builders were advised to use brick, because they are asserted to be more durable than wood, and because the upkeep of a brick house is less than of one built of lumber.

The reasoning overshoots the mark. A brick house may stand longer than one of wood, but even that will not hold in all cases. The walls of many a brick building crack, sag, crumble, and become unsightly, while those of a wooden house hold their own. It is largely a matter of solidity in building and care afterwards. There are wooden buildings in this country about as old as any of brick, and they look fully as well. There are many frame houses in New England dating long before the Revolution, and they are good yet, and instead of deteriorating with age they have become more venerable and more attractive. The Hancock house at Lexington, Mass., and the house at Concord with the bullet holes in the walls, made April 19, 1775, are examples. There are scores of others.

But durability is not the only point to consider in building a residence. It is not the chief point. Few men build a house with the idea that it will be sheltering somebody one hundred or four hundred years hence. They build for themselves and for use during their own lives and their children's lives, perhaps; but what interest have they in erecting a landmark for some future archaeologist to examine? If that is the purpose, why not construct a heap of earth, as the mound builders did? It is admitted that an earth mound will long outlast wood, brick, or even stone.

That is not, however, entitled to consideration as serious argument. Houses are built for present use and for a reasonable time in the future. With this object in view, no material equals wood, within certain proper limits, and those limits are pretty broad. Wood has a beauty which other materials cannot approach. It is capable of infinite variety. It will conform to tastes. It satisfies where dull. monotonous brick walls only irritate and aggravate. It is a finish for the outside and within. Its soft colors appeal like the tones of a Persian rug. The influence can be felt, can be appreciated, can be enjoyed, but cannot be described.

These are some of the objects in view when a man builds his residence of wood. He may be a little selfish in not caring much about what is going to happen in three hundred years; but he does care what is going to happen while he lives and while he and tas family occupy the bonse. He builds it to use, to enjoy. He constructs something which he knows will be satisfactory. If he is adde to stand the cypense, he may include his tastes with the richest woods of the tropies, and combine colors without number; but if his means are moderate, he still has the pick of the wealth which this country's forests afford. A wooden house may be cheap enough for any man, or expensive in the highest degree. Enough carving may be put on a single panel to pay for the brick to build a flat.

The argument which is advanced to the effect that builders should use brick because that material will not burn is without much merit so far as residences, particularly suburban residences, are concerned. If a fire starts in a brick house the building is apt to be ruined. How much better is it to have a few cracked and blackened walls left standing after a fire than to have a frame house completely consumed? The fire tisk has some weight in city blocks, where fires are apt to spread into conflagrations; but the argument loses nearly all of its force when applied to the isolated house. It is even overworked in the city block, for slow-combustion structures of wood have many a time proved superior to steel and concrete.

References to buildings of brick and stone in countries across the sea are poor arguments against the use of wood in this country. It would be as appropriate to cite the bark clothes of the Papuans as an argument against the use of wool cloth in this country. The Europeans use so little wood because they have so little. When they had plenty they used much; and there are wooden houses in England now standing and in good condition that are not only three times as old as any brick house in America, but older than any brick building in England.

Gifford Pinchot's New Book

A NEW BOOK has been written by Gifford Pinchot, and published by the J. B. Lippincott Company, Philadelphia. It is a small volume and can be read in two hours, but the reader will likely pick it up again from time to time and spend several other hours with it. The title is "The Training of a Forester." It is important that the title be clearly understood; otherwise some might infer that the book is a treatise on forestry. It is not that. Its subject is the forester, not the forest. Its reading is worth two hours of the time of any business man who deals with men—who gives orders or takes orders.

Gifford Pinchot was formerly United States forester. While strictly speaking, he was not the founder of the Forestry Bureau of the Government, he was its organizer and builder. He took it when it amounted practically to nothing, and made it one of the most efficient machines for the transaction of business that has ever existed anywhere. He was a marvelous organizer. He gathered about him a corps of men who were able to work with the minimum of "lost motion." He would not permit a man to do what a cheaper man could do as well. He demanded that every man put his efforts into the highest-class work he was capable of doing, and to waste no time with details which he could leave to another. Theodore Roosevelt on more occasions than one publicly acknowledged his indebtedness to Pinchot for suggestions, ideas, and plans.

The book just published deals with the training of a forester, but much of it applies equally well to the training of any other business man. Of the forestry student Mr. Pinchot says: "To stand well at graduation is or ought to be far less the object of a forester's training than to stand well ten or twenty years after graduation." Students of things other than forestry could profit by remembering that suggestion.

The following quotation from the book will appeal particularly to lumbermen: "The forester cannot succeed unless he understands the problems and point of view of his country, and that is the reason why foresters from other lands were not brought into the United States in the early stages of the forest movement. At that time practically no American foresters had yet been trained, and the great need of the situation was for men to do the immediately pressing work. Foresters from Germany, France,

Switzerland, and other countries could have been obtained in abundant numbers and at reasonable salaries. They were not invited to come because, however well trained in technical forestry, they could not have understood the habits and thoughts of our nearly."

Speaking of men generally, the author says: 'In my experience, men differ comparatively little in mere ability, in the quality of the mental machine through which the spirit works. Nine times out of ten, it is not ability which brings success, but persistence and enthusiasm, which are usually, but not always, the same as vision and will. We all have ability enough to do the things which lie before us, but the man with the will to keep everlastingly at it, and the vision to realize the meaning and value of the results for which he is striving, is the man who wins in nearly every case.'?

The spirit in which a man should go into a good fight and stay in it is thus spoken of: "It is inevitable that the forester must meet discouragements, checks, and delays, as well as periods of smooth sailing. He should expect them and be prepared to discount them when they come. When they do come, I know of no better way of reducing their bad effects than for a man to make allowance for his own state of mind. He who can stand off and look at himself impartially, realizing that he will not feel tomorrow as he feels today, has a powerful weapon against the temporary discouragements which are necessarily met in any work that is really worth while. Progress is always in spirals, and there is always a good time coming. There is nothing so fatal to good work as that flabby spirit under which some weak men try to hide their inefficiency—the spirit of 'What's the use?''

The point of contact between the forester and the men with whom he must deal is thus explained: "The practical men with whom the forester must do his work—lumbermen, cattlemen, sheepmen, settlers, forest users of all kinds—are often very much his superiors in usable knowledge of the details of their work. Their opinions are entitled to the most complete hearing and respect. There is no other class of men from whose advice the forester can so greatly profit if he chooses to do so. He is superior to them, if at all, only in his technical knowledge, and in his broader point of view which he has derived from his professional training. It is of the first importance that the young forester should know these men, should learn to like and respect them, and that he should get all the help he can from their knowledge and practical experience.

The following quotation is one in which most men of large affairs will agree with Mr. Pinchot: "There is no more valuable subordinate than the man to whom you can give a piece of work and then forget about it, in confident expectation that the next time it is brought to your attention it will come in the form of a report that the thing has been done. When this master quality is joined to executive power, loyalty, and common sense, the result is a man whom you can trust. On the other hand, there is no greater nuisance to a man heavily burdened with the direction of affairs than the weak-backed assistant who is continually trying to get his chief to do his work for him, on the feeble plea that he thought the chief would like to decide this or that himself. The man to whom an executive is most grateful, the man whom he will work hardest and value most, is the man who accepts responsibility willingly, and is not continually under his feet. But the wisdom of letting a good man alone is no less commonly understood. It is sometimes as important for the superior officer not to worry his subordinate with useless orders as it is for the subordinate not to harass his superior with useless questions. Let a good man alone. Give him his head."

It is now announced that by a process of shredding, boiling and treatment of refuse with chemicals, a Frenchman has succeeded in producing artificial wood which gives good results as planks, beams, laths, mouldings, etc., of various sizes and shapes. The material is worked like natural wood and is said to be especially adaptable to the manufacture of match stems.

Walnut Is Coming Back

in turning out this

particular character

of furniture, and he

It is interesting to observe, in watching the gradual changes which con stantly are taking place in the manufacture of various styles and types of furniture, the direct reversals of demand which become apparent from time to time, loth as to style and as to raw material going into such lines of manufacture. The fickle consumer, who is probably egged on by the ambitious manufacturer, that gentleman being anxious to stimulate trade by creating a reason for buying new furniture, constantly demands something different.

VISUAL EVHIENCE THAT THERE ARE STILL SOME OF THE SO-CALLED OLD-FASHIONED WALNUT THIESE TO BE HAD A FINE SAMPLE FOUR FEET IN DELAMETER. THERE ARE PLENTY MORE LIKE IT.

On the floors of the furniture exhibits each year are shown new styles just as at the conventions of tailors, modistes, etc., are shown new styles of apparel.

The modern business man, whether he is manufacturing clothes, hats, automobiles, or furniture, is always striving for something different with which to catch the eye of the prospective customer, and this is probably as true in connection with the manufacture of furniture as in any other line of business.

The changes in styles are unquestionably more rapid and more apparent than are the changes in actual woods used. This is true because the former changes are more readily made than are the latter and are more practicable to make. For instance: It is not possible to change the kind of raw material used beyond a certain number of woods, as there are but few woods qualified to be used in high-grade furniture which can be secured in sufficient quantities to make their use commercially possible. Thus the pendulum merely swings in favor of one or the other of these woods from season to season. In the piano trade, the piano manufacturer will one year turn out goods running seventy-five per cent to walnut and twentyfive per cent to mahogany or other lines. The next year it will be seventy-five per cent mahogany and twenty-five per cent walnut and other woods. The following season, perhaps, it will be evened up between mahogany and walnut, with a smaller percentage of other lines. The same condition is true, probably to a less varying extent, with the furniture manufacturers, who are more closely confined to the use of the same woods season after season than are piano manufacturers. However, they do vary their requirements with changes in styles, as the market for certain articles manufactured from specific raw materials seems to be specified.

It is a fact that in the manufacture of certain styles of furniture a certain wood is essentially proper and should be used. However, it is not always possible for the furniture manufacturer to turn out his goods made from that particular kind of wood, or at least he does not think it is possible. As an instance of this, the sixteenth century style of furniture calls essentially for black wabut, as that particular kind of wood was originally used for this particular purpose. However, the furniture man has come to believe that the supply of this beautiful wood was not adequate to meet his demands

has taken a chance on making up this style in mahogany. It really seems a pity that he has been forced to labor sion, as it is unquestionably a fact that sufficient walnut is available to take care of all his requirements, and then leave plenty over for next year. Thus, if he had been closely conversant with conditions as they actually are, he would have turned out an article in getting out this particular style of product which would have onformed absolutely

to the requirements as specified by the connoisseur who not only keeps in view what the requirements of the present are, but also what shows to best advantage in old styles.

In this connection is shown a photograph that should go far to refute the mistaken idea that the stand of the so-called ''old-fashioned'' black walnut trees is exhausted. This splendid specimen towered high up to the first limb, and was fully four feet in diameter. It has been manufactured by a prominent walnut concern. It should be borne in mind that there are plenty of other such trees still in existence, and that the price commanded by the product of these trees is in no way exorbitant or prohibitive.

Olive Wood of Commerce

The wood of the olive (Olca europaca), especially the root part, is beautifully clouded and veined, has an agreeable odor, and is susceptible of a high polish which it retains. It is highly esteemed for these reasons by cabinet-makers, by whom it is fashioned into the finest work. It was of this wood, so hard and lasting and of such fine grain, that the Greeks sculptured their divinities before marble and ivory came into use. It is hard, heavy (about sixty pounds per cubic foot), strong, rather brittle, very close and fine-grained, and works and turns very easily, but splits badly or rather crumbles under the knife. It is light yellowish-brown with irregularly wavy dark lines and mottlings, especially near the root, and often resembles boxwood, but it is not so hard.

The pores, which are evenly distributed throughout, are very small and not visible to the unaided eye. The pith rays are very narrow, and cannot be seen on a radial or transverse surface except under the hand lens. The wood is used chiefly in turnery and carving for small articles, souvenirs, fancy boxes, paper knives, pen holders, etc. The olive wood is imported into Birmingham, England, where it is used so commonly for making mementoes of the Holy Land.

The principal source of supply of olive wood is in southern Europe, but in recent years a good deal of the wood used in this country was obtained in southern California, where the olive is now extensively cultivated.

The Lumbermen's Round Table

ONE-FACE GOOD LUMBER

It has been a noticeable tact that many lumbermen have taken advantage of the ability of consumers to use lumber with reference to one site only, and have been specializing in the sale of one-face firsts and seconds. There seems to be no possible objection against this description, and on the other hand, many arguments in favor of selling it on that basis.

In the case of a table-top, or furniture case-work, or interior finish, or any number of commodities that might be mentioned, only one side is exposed. The consumer does not care what is on the worse side, so long as the material which is exposed is clear. Consequently there is neither rhyme nor reason in his paying for lumber that is clear on both sides, when but one face is to be seen in actual use.

The description of the lumber as one-face firsts and seconds is different from the term select, even where a definite select grade is provided for in the rules. A select board is good on one side, of course, but the usual provision is that the worse side shall not be below a No. 1 common. In the special grade referred to, the other side may be anything whatever, and as nobody cares how many defects it carries this seems an equitable arrangement.

Certainly the plan is a good one for the consumer, who gets what is to all intents and purposes good lumber for less than firsts and seconds prices, and for the lumberman, who can select his common stock so as to make good lumber out of it, as far as one face only is concerned. And, be it noted, this selection means service to the consumer, for which the latter should certainly be willing to pay.

IT ALL DEPENDS

The present popularity of mahogany, and the fact that poplar, in point of price, is far below the place it occupied in the heydey of the panel poplar craze, makes the following story, told by a man who knows, seem almost beyond the limit of credibility; but it happened, nevertheless, and only goes to show that everything is relative, and that there are few hard and fast, unchangeable standards by which to measure quality.

"During the time when wide poplar was sky-hooting," said this lumberman, "we were selling a good deal of our stock abroad. There was quite a scarcity of panel stock, as everybody recalls, and at one time poplar was selling on the other side around the \$100-mark. I have in my files a letter from our Liverpool representative stating that owing to the high price and scarcity of panel poplar, some manufacturers in England were 'substituting' mahogany for it.

"'Our friends in the mahogany trade may think that this is a case of stretching the long bow, but it actually happened. The substitution of mahogany for poplar was not of course an index of their relative intrinsic values; and yet people are too likely to judge values by price, rather than by an examination of the wood itself."

TEACHING THE YOUNG IDEA

Speaking of mahogany reminds one that those engaged in its manufacture and sale have played their cards intelligently, and have carefully cultivated the demand until it is a steady, dependable thing; and now mahogany is a staple which could hardly be dislodged from a permanent position of popularity by any imaginable means.

One of the methods recently used by a large concern in that field is suggestive of the careful thought given to the entire subject of stimulating the demand. The company has been sending to manual training schools supplies of mahogany at a figure below the market, in order to get the boys to working in that wood. The advantage of winning friends for their product among the youngsters now growing up is undoubted; while on the other hand, it must be remembered that in many cases furniture which the

scheol-boys make goes home, to be used and admired by the family. If many pieces are of mahogany, it is almost certain that the suggestion to buy other pieces made of that material will be presented so strongly as to have a decided effect on consumption.

Most lumbermen have taken demand as a matter of course. The mahogany people have consciously fostered theirs. There's usually a reason for a big success of that kind.

DISCOVERING THE TRADE JOURNAL

One good result flowing from the co-operative work done by lumber associations along the lines of educating the public to the value of their special commodities, is that the trade journal has been re-discovered in the process of studying mediums and discussing methods of getting results.

Associations which have worked up interesting and worth while things to say, have found that their publication in the trade journals has brought unexpectedly good results, showing that readers of the trade press have only been waiting for an opportunity to respond.

This has encouraged individual manufacturers, who formerly believed in the "standing eard" and yet grumbled good-naturedly now and then because they didn't get results, to take more pains with their copy. Such effort almost invariably produces a very desirable effect, either increasing sales or making sales easier to accomplish than previously.

On the outside, advertising agencies, which were once content to announce that they handled publicity in "newspapers, magazines, street cars and outdoors," now add "and trade journals," to the list, knowing that people have become interested in that method of getting publicity.

Those among the lumbermen who have been making proper use of space in the trade journals have known the truth of the situation all along; but others are only now discovering the proposition, and seeing things in their true light. And the discovery will help everybody.

WALNUT IN THE MUSIC TRADES

Indications that black walnut is to resume its rightful place among domestic consumers of hardwoods, and to be properly featured in the manufacture of furniture, interior finish and other important lines, have recalled the fact that the music trades have always been strongly in favor of the use of the wood.

Many piano manufacturers have continued to give prominence to cases made of that kind of material, even though they knew that the pianos would have to make their way by sheer beauty and in spite of lack of accord with their surroundings of house-finishing and furniture. The vogue of early English and mission styles, however, helped the use of dark woods of all kinds, and has made it easier to maintain the use of walnut in that business.

It is also said that the talking-machine manufacturers are admirers and supporters of walnut, and that they are planning to feature it with mahogany and oak in the production of their cases. If walnut has ever been out of fashion, it seems to be certain that it is coming back with a rush; and it deserves all that may ever be said of it as to quality.

STUDY THE FACTORY END

A hardwood flooring man recently told with great glee of a solicitor for a liability insurance company who opened the interview by saying, "What kind of machinery do you use in this plant?"?

"That chap," said the flooring man, "may have thought that he could expose the densest of ignorance without prejudicing his case; but I certainly don't believe in giving business to people who haven't the slightest conception of my requirements."

This was a good point; yet how many hardwood lumbermen can go into a consuming factory and discuss the peculiar requirements of the manufacturer with the same familiarity they exact of the insurance, railroad or machinery man with reference to their own proposition?

True, many consumers discourage discussions along that line; but at the same time, the more the lumberman knows about the inside of the factory, the better he can serve it. The manufacturers and the lumbermen ought to get together on this proposition.

RED GUM IN DISGUISE

Red gum, unfortunately, is one of the best substitutes in the world. It is as good as birch in this respect, and its versatility in looking like other woods is giving it an undesirable reputation. That is to say, gum is a wood which has qualities sufficiently good to entitle it to a place among other high-grade woods in the furniture, interior finish and other trades, on its own merits; and putting it out in disguise, as it were, is causing it to be regarded as a good material merely for imitative purposes.

Gum is used in interior finish to represent anything from walnut to mahogany. Furniture manufacturers are using it stained as mahogany, and are likewise taking figured gum and working it up in connection with Circassian walnut. Some figured gum is being put out to consumers under the name of Circassian.

There is no reason why this should be. Red gum, when figured, has a most pleasing appearance, and even without figure shows up nicely in its natural color. Manufacturers of gum would do well, if they expect it to bring prices such as were predicted until a short time ago, to encourage its use as gum, and not simply as a handy substitute for everything else under the sun.

ON KNOWING THE TRADE

The average sawmill man has very little idea as to the ultimate use to which the lumber he cuts is put. He probably sells to jobbers to a large extent, and even if he sells direct to consumers he seldom studies the factory end of the business in order to see just how the lumber is handled and why one grade is used rather than another. That this lack of knowledge of the consuming industries is a handicap can hardly be denied, for it is mainly by

studying the needs of his customers that the modern business man is winning the way to success.

In striking contrast with this system are the methods used by a large mahogany house, which sends members of its official staff not only to all of the leading markets in this country, but abroad, for the sole purpose of getting a line on the conditions which go to make the market. It has a survey of the consuming interests of the world constantly before it, and it governs its operations from taking out logs in the forests of Yucatan or Africa to operating its manufacturing plants, according to the results of the first-hand investigations which it conducts everywhere.

The average lumberman cannot, of course, make such an exhaustive study as this; but he should certainly make a point of finding out everything that it is possible for him to know regarding the possible uses to which his product is being put.

ADVANTAGE OF VENEERED WORK

One of the greatest difficulties connected with manufacturing solid tops for use in furniture manufacturing is making invisible joints. In fact, it might almost be said that there is no such thing as a joint which cannot be easily detected without the aid of glasses. Some of the manufacturers of extremely high-grade furniture—who say, by the way, that their material cost is only two or three per cent of the total cost of the finished article—assert that their finishing is of such a nature that the presence of the joint is absolutely hidden, so that it is impossible to notice it. But this is not the rule.

The use of veneered tops, correctly matched and properly glued up, gets rid of this trouble, because it is much easier to get a proper joint when veneers are used than when solid material is glued together. Open joints are found in veneered work occasionally, it is true, but it is also true that, taken by and large, veneered tops are seldom found defective in this respect. The improved appearance of the veneered work on this score alone, not to mention the better matching that is possible through the use of thin stock for face work, ought to be a strong selling argument for the veneer manufacturers.

Pertinent Legal Findings

ASSUMPTION OF RISK BY EMPLOYE

The mere fact that an employe has notified his foreman of a defect in appliances used by him, such as a defect in tongs used in logging operations, does not make the employer liable for injury resulting from such defect unless the employe remained at work in reliance upon assurance that the defect would be promptly repaired. Unless he relied upon any such promise, he assumes the risk of continuing his work with a defective appliance. (Texas Court of Civil Appeals, Jones vs. Walker County Lumber Company, 162 Southwestern Reporter 420.)

UNLAWFUL LABOR UNION AGREEMENT

An agreement whereby carpenters and joiners bind themselves to refuse to work on any job where trim or finish made in a nonunion shop is used is violative of the Federal anti-trust law, if it involves interstate transactions. (United States District Court, Southern District of New York, Irving vs. Neal, 209 Federal Reporter 471.)

BREACH OF AGREEMENT TO LEASE LAND

One who broke an agreement to lease land for use as wagon works is liable in damages to the wagon works company for the excess of the value of the use of the premises for the agreed term above the rental price agreed upon. (Georgia Court of Appeals, Williams Wagon Works Company vs. Gunn, 80 Southeastern Reporter 668.)

SCOPE OF EMPLOYER'S LIABILITY POLICY

A policy indemnifying a lumber company against injury to "saw-mill" employes did not cover accidents to mill hands while drilling

an artesian well for use in connection with the mill. (Louisiana Supreme Court, Rust Lumber Company vs. General Accident, Fire & Life Assurance Corporation, 64 Southern Reporter 122.)

INACCURACY IN MECHANIC'S LIEN STATEMENT

The Minnesota Supreme Court has just held that a mechanic's lien for building materials furnished by a lumber company was not rendered invalid through the fact that the property was misdescribed in the lien statement, where it appeared that the lot described and that upon which the building was actually constructed were both owned by the same person and together constituted part of the inclosure appurtenant to the dwelling house constructed. (Atlas Lumber Company vs. Dupuis.)

ACCIDENT TO SAWMILL EMPLOYE

A sawmill employe was guilty of contributory negligence in attempting to cross a live roller bed to avoid an approaching plank, where he could have easily avoided the plank by jumping to one side, and therefore he is not entitled to recover for consequent injury to his foot which was carried by a roller through an opening into a saw. (Louisiana Supreme Court, Patterson vs. Germain-Boyd Lumber Company, 63 Southern Reporter 930.)

INDEFINITE CONTRACTS UNENFORCEABLE

A contract employing plaintiff to cut timber was too indefinite to be enforced by him, if it did not show how much timber was to be cut, when the work was to be done, where the logs were to be delivered, or how much equipment was to be furnished by the employer. (Georgia Supreme Court, Prior vs. Hilton & Dodge Lumber Company, 80 Southeastern Reporter 559.)

XX

Traffic Matters Around Memphis 🕏

It is announced that a number of prominent hardwood lumber manufacturers in Mississippi have filed a petition with the Interstate Commerce Commission, styled the Bellgrade Lumber Company et al. vs. the Illinois Central and Yazoo & Mississippi Valley roads, through which it is sought to make the rates in effect on gum applicable to oak and all other hardwoods. About a year ago the commission allowed the roads in question to advance rates on hardwoods from Memphis to New Orleans to twelve cents per hundred pounds but stipulated in the order that the rate on gum from points south of the main line of the Southern Railway in Mississippi to New Orleans should be only ten cents, and that from points north of the main line of the same road and south of the Mississippi state line should be only eleven cents. The present petition, which is being handled by the Southern Hardwood Traffic Bureau, through J. R. Walker, its attorney, with headquarters in Washington, and J. H. Townshend, secretary-manager, with offices in Memphis, is signed by a number of Mississippi firms, including the following, in addition to the Bellgrade Lumber Company; Alexander Brothers, Belzoni, Miss.: Barr-Holaday Lumber Company, Greenefield, O.; Darnell-Love Lumber Company, Leland, Miss.; R. J. Darnell, Inc., Memphis and Batesville, Miss.; John Dulweber Company, Cincinnati; Green River Lumber Company, Memphis; Lamb-Fish Lumber Company, Charleston, Miss.; S. C. Major Lumber Company, Memphis; Russe & Burgess, Inc., Memphis; Tallahatchie Lumber Company, Phillip, Miss.; Taylor & Crate, Memphis; A. N. Thompson & Co., Memphis, and Ward Lumber Company, Chicago.

After the filing of this petition, a meeting of the Southern Hardwood Traffic Bureau was held here at which it was decided that an intervening petition should be filed asking that, when a hearing was arranged in the case of the Bellgrade Lumber Company, Memphis lumbermen should be given the privilege of presenting evidence in favor of a rate of eleven cents on hardwood lumber of all kinds from Memphis to New Orleans. This will be filed in the name of the Anderson-Tully Company against the Illinois Central and Yazoo & Mississippi Valley roads. As giving some idea of the active interest taken in this matter, it may be stated that the following well-known firms and individuals doing business here have become parties to this intervening petition:

Anderson-Tully Company, Bennett Hardwood Lumber Company, Chickasaw Cooperage Company, I. M. Darnell & Son Co., Darnell-Love Lumber Company, Columbia Package Company, R. J. Darnell. Inc., Dudley Lumber Company, F. T. Dooley Lumber Company, Gayoso Lumber Company, C. S. Gladden, Goodlander-Robertson Lumber Company, Green River Lumber Company, C. D. Hendrickson Lumber Company, C. M. Kellogg Lumber Company, Kennedy Heading Company, May Brothers, Memphis Band Mill Company, Memphis Hardwood Flooring Company, Memphis Veneer & Lumber Company, McLean Hardwood Lumber Company, Mossman Lumber Company, Moore & McFerrin, Nickey Brothers & Bass, Inc., Nickey Sons & Co., Inc., Nolan Brothers Hardwood Lumber Company, Russe & Burgess, Inc., James E. Stark & Co., J. V. Stimson Hardwood Company, P. F. Stone, Tennessee Hoop Company, James Thompson Lumber Company, Tschudy Lumber Company, Vanden-Boom-Stimson Lumber Company and the John M. Woods Lumber

The Memphis and Mississippi firms have joined hands on the issues involved in this contest and believe that it will be possible to secure the lower rates sought. It is pointed out that Memphis is only a few miles above the Mississippi state line and that, if the gum rate is applicable to oak and other hardwoods, giving a rate of eleven cents to New Orleans, there is no reason why Memphis should have to pay one cent more for the additional haul. There is a large amount of money involved in the contest and the fight promises to be a rather strenuous one.

J. H. Townshend, secretary-manager of the bureau, is just in receipt of information that the officials of the Louisville & Nash-

ville road will shortly issue tariffs in conformity with the ruling of the commission about a year ago dealing with transit arrangements. The other roads affected immediately put in tariffs providing that refunds on shipments of logs could be had regardless of the kinds of logs shipped in or the kind of lumber shipped out. The Louisville & Nashville, however, insisted on holding back the refunds unless the recipient of gum logs shipped out gum lumber. The bureau was preparing to file a petition with the commission seeking to compel the compliance of the Louisville & Nashville when this news was received. May Brothers, Nickey & Sons Co., Inc., Nickey Brothers & Bass, Inc., the Memphis Veneer & Lumber Co., and several other prominent firms here are directly affected by the tariffs soon to be issued.

The printer has just completed the annual reports of the Southern Hardwood Traffic Bureau and copies of these can be had upon application to the general offices of that body in Memphis.

J. H. Townshend has returned during the past few days from Washington where he went to appear before the Interstate Commerce Commission in protest against the proposed advance of five per cent in general freight rates. He and James E. Stark, one of the board of governors of the Southern Hardwood Traffic Bureau, were the representatives of this body before the commission. Mr. Townshend is of the opinion that the commission will allow some relief to the railroads but he doubts if this will come in the shape of any general advance in freight rates, especially as affecting lumber and forest products. He thinks that there will be new orders covering the handling of business at the more important terminals, switching charges, handling of reconsignments and other service performed by the roads.

Logging Conditions Around Memphis

Prospects are a little more favorable for an adequate supply of timber at Memphis and elsewhere in this territory. This is due to the rise in the Mississippi and its tributaries and the consequent more satisfactory stage for the handling of logs by water. Rafting is now possible and the higher water is enabling log owners to reach timber that has heretofore been inaccessible. The river mills have been put to their wits' end to secure enough timber to keep them in operation and they heartily welcome the change. The river is some twenty feet lower than at this time last year, but lumbermen in this city and section are much better pleased with the current stage than with that of last year. There are prospects of higher water in the near future, owing to the heavy rains and snows in the upper valleys of the Mississippi, Missouri and Ohio rivers, but nothing suggesting a repetition of flood conditions prevalent during the spring of 1913 and 1912. So far as rail receipts of timber are concerned, these show quite a pronounced shrinkage compared with last year. The shortage since January 1 is estimated at 700 to 800 cars, and an official of the Valley Log Loading Company is authority for the statement that the outlook is for smaller arrivals by rail in March this year than during the same month in 1913. The winter, however, has been quite open and a great deal of timber is being prepared for shipment, with the result that prospects point to a heavier movement after April 1 than was witnessed during the preceding season. Altogether the mills are congratulating themselves on the improved outlook in this respect.

Waiver of Delay in Delivery

A buyer's acceptance of goods after the date when the seller has contracted to deliver them waives any right to rescind the contract on account of the delay, but does not prevent the buyer from making a claim for damage resulting to him through the seller's failure to make the delivery within the stipulated time. (New York Supreme Court, Appellate Term; Molin vs. New York & Pennsylvania Smokeless Coal Company; 145 New York Supplement 116.)

The Country's Pulpwood Supply

In a recent address by Raphael Zon of the Forest Service before the American Pulp and Paper Association in New York, the outlook of the pulp industry in this country was reviewed.

"Whatever the future use of wood may be in the construction and building trades," says Mr. Zon, "the use of wood in the pulp and paper industry has been constantly on the increase, and as far as our present knowledge goes, there is no substitute that will take the place of wood in pulp and paper making. While there are many plants the fibres of which are as well or better adapted to the manufacture of paper, there is no other plant which is capable of producing cellulose so cheaply and so compactly as the tree. No other plant can be grown on such a large scale, nor in such adverse climates nor on such poor, rocky soils as our northeastern spruce, hemlock, and balsam, which are the chief sources of the pulp and paper industry. Practically all of the substitutes for wood which have so far been suggested are bulky, producing a short fibre and a small yield. These may possibly become important in paper making when the suitable woods are no longer obtainable. Meanwhile the use of wood in the pulp industry is increasing rapidly at the expense of all other materials. Within the last decade alone, from 1899 to 1909, the use of wood in the manufacture of pulp has increased from two to four million cords annually, an increase of 100 per cent; this use is bound to increase in the future, though probably not at the same rate as in the past. It has been estimated by the Forest Service that by 1950 the amount of wood probably needed each year for the pulp and paper industry will be in the neighborhood of 16,000,000 cords, or approximately four times the present requirement. Of course all such estimates must be taken with some grains of salt, as it is impossible to tell what the actual demand may be; but judging from the variety of uses now made of pulp and paper, and the rapid increase in output which has taken place during the last ten years, these estimates are probably sufficiently conservative."

The speaker went fully into the problem of growing wood for pulp and showed that satisfactory returns could be expected. Then turning to the matter of utilizing waste, and thereby making present supplies go farther, he declared that he did not know of any other wood-using industry that practices such close utilization as the pulp and paper industry. Topwood, including branches, is now being used by some pulp and paper manufacturers, especially in Pennsylvania, in sizes as small as two inches outside bark at the middle of the stick, and the only other competitors for the same kind of material are the acid factories. The use for pulp of waste material left after lumbering has recently been introduced in parts of Pennsylvania. Hemlock tops and broken, defective logs are peeled, cut into 5-foot lengths, piled in the woods, and sold by the cord. From 250,000 to 260,000 cords of slab wood and other soft mill waste are now consumed every year for pulp. In 1908, hemlock formed forty-one per cent of the sawmill waste used, and its average value was \$4.07 per cord, about two-thirds that of hemlock cordwood in the round. In Wisconsin, sawmills often sell their homlock slabs to paper mills for from two to three dollars per cord.

It has been estimated that the total stand of woods chiefly used for pulp is 130,000,000,000 board feet; of this 50,000,000,000 board feet is spruce, 75,000,000,000 board feet hemlock, and 5,000,000,000 board feet balsam fir. These three species are now being cut for both pulpwood and lumber at a rate that should exhaust the entire stand in about twenty-five years, not counting the growth of new timber on one hand nor the increasing demand for it on the other.

This discouraging outlook, however, is not so black as it seems. First some new growth is added on every year. Our wild woods, poorly as they are stocked, burned, and overcut, are still producing some new wood. Even assuming that the increment on the 130,000,000,000 feet of standing timber is only one and one-

half per cent, that we dd mean ar annual accement of about 2,000,000,000 feet, or 4,000,000 cords, provided the forest area occupied by this tumber is not being actually devastated. Considering, therefore, the entire spruce bearing land of the Northeast and the Lake States, there is just enough timber produced every year to maintain the present demand for pulpwood. The pulp industry, however, is not the only one that lays claim on this increment. As a matter of fact, the lumberman still uses nearly three fourths of the entire cut of spruce, hemlock, and balsam for lumber. Small as this increment is, still it contributes to the prolongation of the present stand.

Mr. Zon discusses probable additional supplies which may be had by bringing in species not now much used. Among such are firs of the western part of the United States, lodgepole pine and Engelmann spruce of the same region, and jack pine of the northern part of the United States and Canada.

In addition to the conifers, there are still untouched supplies of hardwood which grow within the same region as the spruce, such as maple, beech, and birch, which are already finding use in the manufacture of chemical pulp and paper.

Lightning and Forest Fires

Philosophers, so called, formerly spent much time in theorizing how mankind procured the first fire. To those lazy thinkers it seemed a great mystery; but if they had spent half as much time in observation as they wasted in meditation, they might have found something out. Lucretius thought man first obtained fire from "hot ores," but neglected to explain what heated the ores. Others thought trees rubbing together started the first fire; others traced the origin to rolling stones; still others to sparks struck from horses' feet. Not one suggestion of lightning occurs anywhere in the literature of ancient times, unless the lines of an old Greek poet may be so interpreted when he wrote: "With sacrilegious hands Prometheus stole celestial fire and bore it down from heaven."

Henry S. Graves, chief of the United States Forest Service, has been conducting some investigations that would have caused Lucretius, Pindar, Hesiod and the other dreamers to sit up and take notice. He has collected statistics of forest fires in 1913, and shows that more were set that year by lightning than were caused by any other agency, not even excepting locomotives and all other steam engines. That finding is remarkable. Nearly every woodsman can recall an instance where a tree was fired by lightning; but few have supposed that no other agency equals lightning in the number of fires set.

Twenty-two states last year reported forests set on fire by lightning; but of all regions in the whole country, California was the worst. A single storm started a string of fires 750 miles long in that state, extending along the mountains from Oregon to Mexico. More than 700 separate fires were set in a brief period. The situation was aggravated by the absence of rain during a period of unusual electrical disturbance.

All the precautions which it is possible for man to take cannot greatly lessen the danger of forests being set on fire by lightning; but the consequent damage may be much decreased by being zeady to fight. In time of peace prepare for war is the policy pursued by Forester Graves. He has his forces organized, his tools and apparatus at strategic points, trails built and telephone lines strung, and when lightning, locomotives, incendiaries, or campers start a fire, the fighters converge from all sides to the point of danger and usually win in a short time. The effectiveness of the system is shown by the fact that half of the fires are extinguished before they burn over a quarter of an acre, and half of the remainder before they spread over ten acres.

It is easy to see what the result would be if fires were left to burn themselves out as formerly was the custom.

W. W. KNIGHT, INDIANAPOLIS, FIRST

GORDON C. EDWARDS, OTTAWA, ONT PRESIDENT.

E. F. PERRY, NEW YORK, N. Y., SECRETARY.

National Wholesalers' Annual

The serious derangement in train schedules, and in fact, in some cases the entire tying-up of traffic, seriously affected the attendance at the twenty-second annual meeting of the National Wholesale Lumber Dealers' Association held at the Iroquois hotel, Buffalo, on Wednesday and Thursday, March 4-5. As a matter of fact, there were only 200 in attendance at the opening session, and some of the regular attendants did not succeed in reaching the convention at all.

The convention was called to order at 10:30 a. m. on Wednesday by President N. H. Walcott. Mr. Walcott opened his remarks with an expression of appreciation of the efforts of the respective committees of Buffalo lumbermen and those representing the city of Buffalo. He introduced John Sayles, personal representative of the mayor, who extended the usual welcoming address. Mr. Sayles said that they had various kinds of conventions, but that the National Wholesale Lumber Dealers' Association was an organization which the city was especially glad to welcome within its boundaries and that they were very much gratified to have the opportunity of extending the full hospitality of the city. He paid a distinct compliment to the mayor, and then in turn to the lumbermen in general, who, he said, have shown themselves to be the most liberal, broad-minded and clean-cut of business men and that they have always stood for the best in public work, both municipally, state and federal.

Mr. Sayles then went on to describe the various features of Buffalo which make it a desirable city in which to hold a convention. He told of its libraries, its churches, its parks. He described the population of the city and said it has great possibilities for development. In closing he urged those in attendance to enjoy their stay to the utmost.

John N. Scatcherd of Scatcherd & Son, lumbermen of Buffalo, was next called upon by President Walcott. He delivered a very satisfactory address of welcome in behalf of the Buffalo lumbermen. Mr. Scatcherd was formerly president of the wholesalers' association, and in fact was one of its originators. He expressed himself, in speaking for the local lumbermen, in being very much pleased in showing what Buffalo and the Tonawandas can do by way of entertainment. Mr. Scatcherd recalled to mind the last convention of wholesalers held in Buffalo twenty years ago, and said it was the second in the history of the association. He said that recollection of that convention brought to him memories of the many faces which are now removed for all time from the convention floor.

After discussing the value of the association work and its possible accomplishments, he also paid a tribute to the aims and purposes

of lumbermen, and expressed the hope that those in attendance would enjoy their stay to the fullest.

President Walcott called upon Vice-President Gordon C. Edwards of Ottawa to respond to the address of welcome. Mr. Edwards expressed himself in very satisfactory terms.

President Walcott then delivered his annual report, which in part, is as follows:

Address of President

As is usual custom, the president gives an account of his stewardship and the progress made by the association during the year.

I think that but few of the members, who are not intimately connected with the details, realize the magnitude of the work of the bureau of information. To handle same properly, we occupy a suite of nine rooms, employ from seventeen to twenty-three stenographers and clerks, in addition to our secretary and department managers. In connection with colections and revisions of reports, we have corresponded with at least 2000 attorneys during the past year. We have at our command attorneys in nearly every large town and in every city in the United States and in most cities in Canada.

The year 1913 was a very trying one. Our bureau of information and our legal department had a busy year. I wish that our members, who do not subscribe to our bureau of information, were more conversant with our work in this department.

As our transportation bureau grows in experience it increases in usefulsess, and I have received letters congratulating us on the good work done, particularly for our members in the mountain country on the line of the Southern Railroad, where there has been a fight made in the last year over the unjust discrimination in rates.

I cannot go into too much detail, as I would infringe on the reports of our department managers, and the chairmen of our various committees.

The departments referred to above require the most attention, and this association has been fortunate in having members who have been willing to give their time and talent to the supervision of this important work. The thanks of the association are certainly due the chairmen of these important committees.

I regret very keenly no gain in our membership. This has been of considerable moment to the chairmen of this committee, the executive committee and the board of trustees.

We do not know of any withdrawals on account of dissatisfaction with our association work, but the financial mortality was large during 1913 and the changes in business many. Nearly every member we have lost has been on account of going out of business, consolidation of business, or failures. It is just such times as existed during 1913 that require more work and more co-operation among our members.

We have saved many thousand dollars to our members this year and could the wholesale lumber dealer, who is not a member of our association, see the work as your executive committee and board of trustees see it, there would be no question regarding the membership.

We have been ably represented in the National Chamber of Commerce. Your board of trustees has taken action and recorded its vote on several

: V BABCOCK, PITTSBURGH, CHAIR MAN NOMINATING COMMITTEE.

N. H. WALCOTT, PROVIDENCE, R. I. RE TIRING PRESIDENT.

important matters brought to our attention by the Chamber of Commerce,

We have had an efficient forestry committee, the chairman of which takes a deep interest in the forestry question. We were ably represented at the Conservation Congress at Washington, D. C.

Nour car stake committee has held one or more meetings and its report will show what was done at these meetings.

The terms of sale and trade ethics committee has had some troublesome problems this year and the chairman of this committee will no doubt embody same in his report.

In reference to your several other committees, I will make no special report, as these you will receive later. I believe that these committees have given their careful thought to the various subjects connected with their work and you will be interested in their reports.

In regard to further work in our association, I have tried to think of some broad line to add to our usefulness. While our association is national in name, and I believe more of a national association than any other lumber organization, at the same time I feel that it should be a national Association in fact

We have a large number of lumbermen's clubs and associations that are all doing good work along their particular line, but the national questions, like forestry, insurance, both fire and marine, freight rates and legislation that affects the manufacture, transportation and sale of lumber, we have no association that can register the opinion of the lumber trade as a whole

The National Wholesale Lumber Dealers' Association is one of the oldest, and a national organization not governed by local conditions, or one line effort, but whose membership consists of wholesalers, manufacturers in all branches of the 'lumber business throughout the United States and Canada, and could best speak for the entire lumber interests and in no way interfere with the work of the various associations. This work might be carried on in the same manner as in the National Chamber of Commerce.

To illustrate.—How does the lumber trade feel in reference to the contemplated advance of five per cent in freight rates? Possibly some lumber organizations are against any advance and will pass resolutions to this effect, sending same to the Interstate Commerce Commission. Others are to favor of some advance, but take no action. The Interstate Commerce Commission is left with the impression that the lumber trade is against any advance to the railroad, while the facts might be entirely to the countrary.

An association like the national could take this up with every lumber association and get its vote on the subject, which would be duly recorded with the Interstate Commerce Commission.

It seems to your president to be a very important proposition, and whether it is our association or some other, I would like to see one association that would be the monthpiece for the entire lumber trade on these national questions. I believe it is worth considering.

It is a pleasure to extend our hearty welcome to the delegates of sister associations. May their visit with us be pleasant and profitable. Our relations with all are most friendly, and we trust will always be the same,

It has been a pleasure to serve you and I desire to thank the executive committee, the board of trustees and the committees and their chairmen for the great assistance given us, also our secretary and department managers for the very courteous treatment extended to me.

We have a good, clean, efficient organization. We have faithful board of trustees, the attendance at our trustees' meetings has been large. All of the efforts of this association have been for a better association and to elevate the lumber business to the highest plane.

I have purposely omitted from this paper more detailed account of the

work of our association, as this will be presented to you in the numerous reports by the chairmen of our committees. We hope our meeting will prove to be a profitable one.

I want to take this opportunity to thank you all for the assistance that has been extended to me during the year.

Secretary E. F. Perry read a very comprehensive report in which he touched upon the various phases of the association's work during the past year. He said it was his seventeenth annual report and that the past year had been one of great activities along the many diversified lines of association work, which unusual activities had been brought about by the unrest and uncertainties in the business world. He expressed himself as believing that the lumber business is erratic, responding to changing conditions seemingly without regard for scientific reasons, and consequently is slow to readjust itself to right levels.

He said the possibilities for co-operating among lumbermen are great as a result of their close association work; that the lack of efficient co-operation is astonishing; that it is difficult to determine whether they feared co-operation or were not yet sufficiently reduced in finances to realize the serious need of co-operation and the consequent saving in time and money by adopting as a body the valuable suggestions which have come through experience to other mercantile associations as a body.

The secretary stated that problems which have come up during the past year have been broad and difficult of solution. He said he would leave the detailed discussion of these problems to the report of the various committees.

The secretary said that one of the principal efforts during the past year had been work, backed up by the prestige of the association, tending to effect the proper adjustment of the selling and handling of shingles in New York state. The main objection was to get the regulation properly fixed, the state having elected to adopt the regulation. Mr. Perry said that he was informed that during the next couple of years many states will follow New York's example and regulate not only the sale of shingles, but of other commodities which are not defined on a regular basis, such as numerical count, bundling, inspection, etc.

The speaker mentioned the New York building code, stating that it will undoubtedly be passed this year and will be copied by many other large cities, thus seriously affecting the lumber trade.

Mr. Perry also said that a great deal of work had been done in connection with the New York state workmen's compensation law effective July 1. He said there is considerable adverse sentiment among millmen and dealers, but that it developed that the law has been fully discussed by a large number of insurance concerns of the state and that it has been stated it will undoubtedly be used as the model compensation law. It has the support of the labor unions and, according to the secretary, while the New York law may be too lib-

eral, conditions must be shaped in conformity to it. He said that the law would undoubtedly be amended later on, although it is claimed by its framers that it is practically flawless. He said it was unfortunate that objections were withheld until it was too late to effect changes, as business men should have interested themselves in the law before it was passed.

He then touched upon the terms of sale, saying that this subject properly claimed attention in the early part of the year. It had been suggested that the subject was old and shopworn, but facts indicate that lumbermen are realizing more and more the importance of having sales contracts include technical terms of settlement and they fully appreciate that such terms seriously affect profits.

He touched upon the prospective report of the railroad and transportation committee and its importance to association members. Mr. Perry said that the work of securing new members during the past year was difficult. He said that he did not agree with some of the lumbermen who claimed that there are too many associations. He said he believed in the variegated lines of associations for respective work in respective localities, that he is fully in favor of the work being accomplished by other organizations that are national in their scope. He stated, however, that in his opinion the National Wholesale Lumber Dealers' Association was among the first to handle international lumber questions and is well able to undertake many of these problems and handle them from an experienced standpoint.

He said an effort had been made to increase the membership during the past year; that the association began the year with 405 members and that without any unusual effort thirty-five new members had been secured. Through causes over which the association had no control, thirty-five were dropped, leaving the membership the same as in the beginning. There is a gain of three in the bureau of information. The secretary said that no other trade association in the country received such co-operative support through its officers and board of trustees. He said that lumbermen seem to be more loyal to their industry than any other set of men and that lumbermen working in this spirit always made themselves felt on legislative questions affecting lumber.

The speaker referred to the proposed Interstate Commerce bill, saying that he had discussed this bill with prominent business men and few of them were conversant with its contents. He said that lumbermen particularly should familiarize themselves with what the bill proposed. Mr. Perry said the wholesalers' association has always stood for right trade conditions and that this new trade commission could, if properly carried out, become a great menace or could be a great co-operative force. Figuring on the probability of the bill being passed, business men should use their efforts to see that it is properly carried out.

The secretary spoke of the further proposed legislation which will require examinations of all corporations which do an annual gross business of \$3,000,000 a year. There are 350,000 corporations in the United States now engaged in interstate commerce, which as defined by Judge Adamson is a pretty broad principle, as he says: "If a gentleman owned a hen in one state and she went over the state line and laid an egg this would be called interstate commerce." The majority of the members of this association are engaged in interstate commerce but do not realize it. The proposed commission would have the right to search into the business secrets of every business, corporation and members of the association, however small that corporation might be, and give public statements of what they may find. Mr. Perry said it would require thousands of agents to make the investigations. These men would not be under civil service, but would be regular appointees who may or may not have qualifications of inspectors. He suggested this fact as a reason for greater interchange of detail in association work in order that members might keep abreast with the times. The secretary urged that it would be to the advantage of business men if a further clause could be added to the commission bill, giving authority to the proposed commission thereby, as a result of investigations made, right business methods may be suggested. This would result in greater cooperation and better means of trade. He said that if upon investigation it is found that this trade commission is desirable the association should insist with all

the forces possible that it be made cooperative and not combative.

Secretary Perry then referred to the decision to hold the meeting in Buffalo, stating that as many of the original members were northern men, men operating in the Lake states, considerable impetus could be given to association activities by holding the sessions at that point.

The secretary then commented upon the social features, stating that this is necessary in business, and not a weak point.

Mr. Perry then said that benefits which will be derived from the close and cordial affiliation of retailers and wholesalers are difficult to describe. He said that some day there will be an organization composed of representatives from all of these various organizations and that the time is not yet opportune or the excuse has not yet presented itself for this organization.

He thanked those in attendance and closed his report.

C. E. Kennedy of New York read a report of the audit and finance committee. The report of Treasurer Henry Cape of New York showed that the expense of carrying on association work is approximately \$40,000 a year.

A. L. Stone of Cleveland, chairman of the board of managers of the bureau of information, presented a short report in which he referred to the coming report of W. W. Schupner, superintendent of the bureau of information. Mr. Stone said the work has been kept up to a high state of efficiency during the year. He said the number of subscribers has increased and that the board is in better shape to serve its members than ever before. He made an urgent appeal to the non-subscribing members to join the bureau and thus share in the benefits and coöperate with one of the most important branches of the association work.

W. E. Chamberlin of Boston read a report of the committee on membership, saying that that body had worked hard during the year, that the unfavorable financial condition prevailing all over the country had made the result of its efforts rather meager. He then repeated the membership statistics given by Secretary Perry, but expressed himself as believing that during the coming year there would be considerable increase in membership, as there is real promise of much more favorable business conditions.

W. W. Schupner, superintendent of bureau of information then read a detailed report which appears in part as follows:

Report of Superintendent of Bureau of Information

We cannot waste any time in accumulating figures but we have revised on an average of twenty-five reports per day. To do this, easily 12,000 requests for statements of assets and liabilities were made; approximately 22,000 special inquiries were made of lumbermen outside the association membership where references were furnished, also in communicating with banks, attorneys, etc. Over 26,000 names were placed on our tracers and 48,000 special inquiries were sent to our members; 800 names appearing on List A. Not included in this are hundreds of special letters required in investigating beyond what can be obtained through the formal inquiry.

This information, when returned to us, has to be carefully distributed each day and placed in the hands of trained clerks where the new report starts on its way to revision, and in its course receives a personal touch and supervision which we believe is not equalled by other credit

institutions.

An examination of the reports you receive will show a larger percentage of statements of assets and liabilities than heretofore. A hard process of education is bringing many a retailer to the point of seeing it to his

advantage to give us full and detailed information.

If we could insist upon each subscriber furnishing us with his list of customers, we would do so, because we know what a real value this privilege is. Seventy-three new lists were sent in last year, and we can point to instances where they have saved a doubtful or bad account. Neglecting to take advantage of this feature of the bureau has also been noted when a failure has occurred and to our surprise we found a member as a creditor, because we knew our report advised caution. Investigation revealed the fact that the member had not filed a customers list with us and relied upon other sources for information. We cannot make our appeal too strong in urging you to help yourselves by keeping us posted with an up-to-date customers list.

It is well to repeat that many a valuable hint is received through voluntary correspondence from members who report an unsatisfactory transaction or an observation which they believe requires investigation. Frequently these lead to uncovering an apparently good condition and place us in position to warn interested subscribers of impending trouble. We urge a free use of the weekly pink tracer sheets and every subscriber will be well repaid for the time spent on these reports. They,

too, assist materially, and romy times ψ_{ij} , and cones revolution that needs watching, or which can be recorded by we are cope, from

Time Court of love Decourtes.

We started the year with claims on hand amounting to 8250,000 new cames amounting to 8272,000 were to-red do-thed and identification beaving in course of settlement 8250,000; 85,000 in tess were turned over to the treasurer, a gain of 8200 over last year and 8800 over the previous year.

This department is growing in the estimation of members and the in creased patronize through claims received is an added credit force which carries much more weight than the increase in carnings indicates. The twofold purpose of the collection department places it on an entirely different basis than the ordinary collection agency. When you send an account to us, you know that all the prestige of the association will be brought to hear to help you get your money, and you also know that your experience will add to the general fund of other or previous transactions and assist some other subscriber in a similar situation, and when he sends us an account, you reap the reciprocal benefit.

No man's judgment is intallible, and if you find an account reaches the point where it requires action, we believe the bureau offers the best possible facilities for collection. Numerous instances could be specified where the association obtained results when others failed to do so, and this is not accomplished because of any particular trick or system, but for the simple reason that our demands for payment are backed by an organization prestige which the unscruppilous debtor fears, and knows he must respect if he would continue in business.

Our business is eagerly sought for by leading attorneys everywhere and we are proud of the personal relations thus established as a means of facilitating the handling of your collection and legal business. We have had to fight attorneys who unscrupulously wanted bankruptey just because trouble was brewing, but we can point to instances where we were instrumental in getting creditors together and obtaining far better results, besides saving a well established business.

The collection department has so firmly established itself as being not only an agency for collecting accounts but as an important adjunct of the co-operative spirit of the bureau of information, that it well merits your fullest support. It broadens the opportunity for specializing in lumber credits and promptly places the bureau in possession of facts which might otherwise be difficult to obtain

No lumberman working alone can grasp every detail necessary to the proper conduct of his business, and especially as a credit man, is he dependent upon his fellow lumbermen for the help and co-operation he can obtain through this organization. The bureau of information is one big business where each subscriber gives some of his time to help the other subscribers. He does this because he knows in this way each reaps the benefit of the other's experience and the bureau is what it is today because of this effective co-operation. The joint effort of the subscribers devoting their thought and time to keeping the bureau informed, and in furnishing facts which a lumberman wants in determining credit. Is the force that places the bureau at the top of lumber credit reporting negencies.

The report of the arbitration committee was presented by Chairman G. M. Stevens, Jr., of New York, who said that serious trouble did not present itself last year. Three cases were referred to the committee and settled. He said that there were fully one hundred cases given consideration at the association headquarters that should have been arbitrated and that the bulk of these were disputed accounts between members and retailers, where both parties had expressed themselves as being willing to submit facts and be guided by suggestions through the home office. He said that in these cases the contesting parties had been well satisfied with the adjustments.

Mr. Stevens said that in addition to the three cases submitted to the committee, two cases were passed upon by the chairman himself without the opinion of the rest of the committee. He suggested that the members pay more attention to building up the files completely, as this is a very necessary part of arbitration work and materially assists the arbitration committee in handling these disputes.

The speaker also said that the committee urges the members to refer differences to the association for adjustment instead of resorting to the courts, as he believes that results in nine cases out of ten are more satisfactory.

The morning session was closed by the official report of the trade relations committee delivered by W. E. Litchfield, chairman. This report follows in part:

Report of Committee of Trades Relations

No association can dispense healthy trade conditions, but we point with pride to our excellent organization and facilities for gaining and giving knowledge, through our reporting department. It is a help to the lumber trade to have all firms doing business rightly reported as such, and in turn, for all of us to be informed of firms whose conduct of business may tend

to undermine and injure the structure of healthy ourness activity which we all are working to sustain. We have all witnessed the success of more than one firm who has demanded and extended promptness in its relations with others.

liquidation we are passing through. The overhead expense of many firms brought some disasters. One northwestern lumber magnate confessed that he was trying to run three nulls where two would produce all the jumber he had been able to sel. Overproduction and uncalled for development of all kinds have been carried to such a degree that great demands have been made and banks have given unusual loans. There is a shortage of money the world over and we cannot hope for better conditions, until tin a sound manner) credit takes the place of cash. I was made somewhat acquainted with the system of Germany in a trip to that country in 1911. ness until we were willing to extend them the same credit that other countries did, that is, a ninety-day basis in buying and selling. He said the average German took pride in paying as he agreed and in every way encouraged his fellow merchant to maintain credit. Credit is a necessary part of the foundation of all business, and few successful men there are Who at some time in their career have not needed it. Every member of our association should assist in keeping up to the highest degree of efficiency our credit department. If your statement is asked for record, send it in.

After touching on the lien laws as affecting the business relations of retailers and speculative builders, the report continued as follows:

It has been thought that the lumbermen ought to appear in the five per cent rate case by going before the Attorney General or Congress to urge the appointment of some commission who could be consulted for the purpose of determining how far men might go in the matter of joint action for the general good, for purposes of conservation, such as (for example) fostering the idea of curtailing the product for the object of encouraging the manutacture of the longer trees and including the top logs; also that there might be some arrangement in logging to leave the small trees standing, While it is true that we should appreciate what the government is trying to do, we in turn should be guided as to how we may confer together for economic and beneficial improvements of conditions. A mutual knowledge of facts in our industry would save a tremendous waste of timber by curtailing the production when necessary and sparing the great volume of deterioration of stock and sacrifice of valuable efforts. A great many small manufacturers are suffering at the present time because of inadequate knowledge of market conditions led to production of uncalled for stocks and this lumber is being forced on the market at a great loss to manufacturer, as well as the consumers who made their purchases at fair market values.

It would seem also that a greater latitude should be allowed along the line of supporting trade ethics, whereby every merchant by his methods and conduct would automatically classify himself, and such as averaged up adversely be distinguished to the extent of being obliged to correct and adjust his business to proper standards. This would be a constructive action and yet we are afraid of overstepping a law which we do not understand.

The report then outlined a plan for working out these suggestions, and then said:

The administration of some phases of the lumber business is carried on with only a partial improvement over what it was fifty years ago; in fact, in some sections and some lines there has been no change. This has resulted in stacking lumber from habit instead of accurate facts and prospects. It seems to me that under the auspices of our organization a monthly bulletin could be sent to our own members and the secretaries of similar organizations, in which significant and important reports could be placed in the bands of those who need them.

The lumber business, like all others, is in a state of transition. Organization is simply an element of business; its tendency is not to take the place of individual effort, but to protect the fruits of such effort. Co-operation does not offer anything in the way of artificial props, but simply insures harmony among factors related to each other, whether in close proximity or not. Association has the function of encouraging individual effort and not discouraging it, and it is especially needful in this period of adjustment that each one look well to his own affairs and as far as possible increase his own independence and thus make himself a dependable support to the new structure which we are inevitably forming.

WEDNESDAY AFTERNOON SESSION

Immediately after the readjournment of the afternoon session, President Walcott announced the appointing of committees on nominations and resolutions. E. V. Babeock of Pittsburgh was appointed chairman of the nominating committee and Lewis Dill of Baltimore chairman of the resolutions committee.

There then followed a discussion of the proposed five per cent

advance of freight rates in the official classification territory. R. C. Lippincott of Philadelphia suggested a resolution to make a speedy decision in the matter, which is of such great importance to the railroad and industrial interests of the country, and said that he desired it to be referred to the committee on resolutions, and that the members give it free and full discussion. Mr. Lippincott spoke of both sides of the controversy, stating that the lumber business had in its development been very much benefitted by the extension of railroads into timbered territory. He said that in recent discussions between the railroads and labor authorities, the government had almost always assisted labor in its controversies and that it was time the railroads now received some consideration from the federal government. According to the speaker, the railroads are unable to take care of the business that is developing because of lack of means with which to provide necessary rolling stock and motive power, and that to deny them this advance in freight rates would result in injury to the industries of the country. He said he was very much in favor of granting this additional five per cent increase. J. R. Williams of Philadelphia seconded Mr. Lippincott's suggestion.

Hugh McLean of Buffalo suggested the inadvisability of the association taking definite action in favor of the increase, stating that in the matter of rates charged for lumber injustice has been done to the lumbermen, and high freight rates have in fact resulted in compelling lumber manufacturers to leave a good part of the tree in the woods, and lower rates on low-grade products would result in material benefit to the cause of conservation. He said that the railroads are more than getting their just share of the lumbermen's profits, and cited as an instance the working of a tract of timber in Arkansas owned by his company, which timber was valued at \$80,000, stating that the hauling of the lumber products produced cost the concern \$78,000 in addition to further amounts on lumber reshipped from Memphis. In other words, the railroad secured from his company more than the actual value of the timber and in addition his concern was obliged to leave about half of the timber lying on the ground on account of the high rates. He said that the cost of freight on hardwood invoices amounted to fifty per cent of the total invoice and that these circumstances would indicate that lumber is bearing more than its share of the burden of freight rates and that until discrepancies and unjust charges should be adjusted, lumbermen should not go on record as favoring a five per cent increase.

Mr. Lippincott suggested that the matter be considered in the broad light of business, as it is probable that inequalities would always exist. He deplored the necessity of leaving low-grade stock in the woods as a result of improper classifications and stated that with proper classifications this condition would be eliminated.

Horton Corwin, Jr., president of the North Carolina Pine Association, stated that only recently that association adopted resolutions favoring this increase and that he personally was strongly in favor of the resolution as he felt the railroads should be enabled to enjoy business prosperity and development. The resolution in his association passed by more than two-thirds majority.

- F. R. Babcock of Pittsburgh stated that six months ago he was more in favor of the increase than he was at present, and that the railroads then had better chances of securing the increase than they have now. He said that the railroads' attitude by way of refusing to place orders for any material or to effect any improvement work is doing a great deal to shift the sympathy of the people to the other side.
- F. S. Underhill of Philadelphia said that the railroads should have the increase if it could be accomplished without affecting the business of the country.
- E. V. Babcock of Pittsburgh said the association should not officially go on record as favoring the increase, that the railroads should first adjust such matters as switching charges and free service, giving certain shippers advantage over others.
- J. V. Stimson of Huntingburg, Ind., was the next speaker. Mr. Stimson expressed himself as believing that lumber pays a higher rate, with risks considered, than any other commodity and that there is a distinctly unfair classification in rates, as a car of low-grade

lumber has to bear the same charge as a car of high-grade lumber, which condition should be altered.

The resolution was finally referred to the resolutions committee.

F. S. Underhill, chairman of the terms of sale and trade ethics committee, then reported, saying the committee had no recommendations to make to the association, that the members should be free to use in their transactions such terms of sale as were best suited to their particular needs, that they have been and will continue to be governed by their own requirements, according to conditions existing in specific cases. He said that it has not seemed possible in the past and does not now seem feasible to bring about the adoption of any terms that will entirely satisfy the various interests of the lumber trade. Mr. Underhill said that the committee believes that for the present at least each concern should use that form of terms that suits its individual concern best.

Regarding trade ethics, he said that the code of ethics adopted by the American Trades Congress and indorsed by the wholesalers' association continues to exert a good influence on the transactions between buyers and sellers of lumber.

Following his written report Mr. Underhill said that it had been suggested in connection with the new currency law that commercial paper, such as notes taken in settlement of accounts, can be used for rediscount in the reserve banks and that it would be a good plan for lumbermen to arrange wherever possible to secure settlement of accounts by note, instead of holding the accounts open for sixty to ninety days longer, as is done now.

H. A. Reeves, Jr., of Philadelphia read a report of the committee on railroads and transportations. Mr. Reeves said that each year the work of collecting claims is increasing. He stated that the Southern Railroad proposed to advance the rates in North Carolina from one-half to five and one-half cents a hundred pounds. The Southern milling-in-transit was another case that now stands submitted to the Interstate Commerce Commission and briefs and a decision are being awaited.

He touched on questions of weighing cars, citing the report of the commission rendered June 18, 1913. Mr. Reeves stated that the protest of the traffic bureau of the association had its effect on the question of wooden boxes and that no change had been made which affects the wooden box industry. He then referred to the proposed five per cent advance in freight rates in official classification territory, saying that the committee is keeping in close touch with this suggested change.

Mr. Reeves added that he has come to realize the scope and importance of the railroad committee since taking hold of that committee as chairman and that he was astonished at the magnitude of its operations. He urged a greater interest on the part of the members in its work.

W. S. Phippen, traffic manager, reviewed at length the operations of the traffic department during the past year. He reviewed each question which has come before it, telling the reason for the action that has been taken and results. Mr. Phippen said that in addition to the specific problems to which the department had given its attention hundreds of other matters had required considerable time and investigation, and numbers of desirable rate adjustments and various corrections to tariff have been effected. The department also furnished information covering a variety of transportation subjects.

The report covering the handling of disputed railroad claims is

as follows:
344 claims on hand March 1, 1913 \$ 8,761.15
513 claims received during the year
\$57 claims handled\$17,683.38
DISPOSITIONS
346 claims collected\$ 7,036.56
77 claims not presented, but returned to members 8,883.30
52 claims withdrawn
475 claims\$17,994.48
382 claims returned unsubmitted March 1, 1914 \$ 7,688.90

Three hundred and seventy-seven claims were collected through the Interstate Commerce Commission.

The fee derived from all collections was \$1,111, or only fifteen per cent of the actual amount collected, which is a very low rate.

Questions discussed in Mr. Phippen's report were: Weighing investigations, wooden box investigation, the proposed five per cent horizontal increase, rate cases, demurrage rules, bills of lading, New York lighterage, etc.

Mr. Phippen concluded his report with the request that the association more fully utilize the service of the bureau, which is maintained for its benefit.

Charles H. Barnaby of Greencastle, Ind., president of the National Hardwood Lumber Association, was introduced by President Walcott. Mr. Barnaby's popularity was warmly attested by the very cordial reception with which he was greeted. Mr. Barnaby said that inasmuch as 150 members of the National Hardwood Lumber Association are also members of the wholesalers' association, he felt particularly pleased to have the opportunity of speaking. Mr. Barnaby said that much of the success of the National Hardwood Lumber Association could be attributed to the membership and efforts of Buffalo lumbermen. He said that his organization had been formed seventeen years ago for the purpose of securing unanimity in grading and inspection rules for hardwood lumber. Mr. Barnaby said that buyers previous to that time all had their individual inspection methods, and that the main consideration of selling a man was a knowledge of his idiosyncrasies in this line. Mr. Barnaby said that as a result of the hardwood association work, hardwood inspection rules are now uniformly enforced throughout the country.

Mr. Barnaby said that since the 1905 meeting of his organization in Buffalo, at which time the association had only 300 members, it has grown to a membership of over 900, and has 65 salaried and fee inspectors working for it directly, in the United States east of Kansas and in Canada.

Mr. Barnaby closed his talk with an invitation to the members of the association to attend the meeting of the National Hardwood Lumber Association, which will also be held in Buffalo, June 18 and 19.

President Walcott then introduced M. E. Preisch, chairman of the committee representing Buffalo and the Tonawandas, constituted for the purpose of affording proper entertainment for the visitors. Mr. Preisch announced that the men's smoker and reception, and entertainment for the ladies the first night had been fully arranged, and that the men had been given the privilege of attending either of the functions.

Edward Eiler of Pittsburgh, chairman of the committee on legislation, followed Mr. Preisch. His report follows in part:

Report of Committe on Legislation

No important national legislation affecting the lumber business was proposed during the past year and there has, therefore, been no special matter brought up for the consideration of the committee.

Considerable work has, however, been done by our association which has been instrumental in helping the lumber business, largely in the state of New York. This was due to the adoption of a new law regarding the selling, marking and bundling of shingles. This legislation being confined to New York state and our worthy secretary, E. F. Perry, being on the ground, it was natural and proper that he should take upon himself the privilege of doing the work and protecting the interests of the lumber dealers. Our association was very instrumental in working out a satisfactory law and it is likely that the laws of other states will be framed to cover the good points of the New York state law.

Our secretary, Mr. Perry, has also spent a great deal of time in the name of the association in working on the new proposed building code for the city of New York.

Our association has also been active in the matter of the proposed recommendation regarding the workmen's compensation bill for the state of New York. Through our association the bill was somewhat modified, although the bill as passed is considered most drastic.

With reference to the matter of five per cent universal increase in freight rates. This matter received very serious consideration at the hands of the board of trustees and after due deliberation it was thought best not to attempt anything at all in connection with it on account of there being so much diversity of interests represented in this proposition and such a wide difference of opinion regarding its ultimate working. Should there be any discrimination against lumber when the matter is finally determined, it will then be in line for our association to take up the matter through its proper committee and get fair and just treatment.

A recommendation has been made by one member of the committee that

the association should pass a resolution favoring legislation whereby timber will be taxed as a crop and not annually as at present. We hope such a resolution will be presented to the association and receive favorable consideration.

In view of the importance of the discussion on car stake, a special committee had been in force with a view of shaping congressional action in this direction. C. F. Craig is chairman of this committee, and his report was listened to with interest. This report also follows in part:

Report of Special Congressional Car Stake Committee

Apparently acting on the suggestion contained in the last annual report of this committee, the board of trustees, at a meeting held on May 23, 1913, requested that this committee hold a meeting and present to the board its recommendations as to future action.

Pursuant to this request, the car stake committee held such meeting on November 11, 1913, and embodied its conclusions in the following report to the board:

The committee recommends that (1) Immediately after the present proposed five per cent advance in freight rates shall be allowed by the Interstate Commerce Commission and become effective, the association shall ascertain the probable cost of proceeding on the lines outlined by William A. Stone, in his letter of September 27, 1910, addressed to F. R. Babcock, then chairman of the committee.

(2) That with the above information in hand, all affiliated associations likely to be interested in the matter shall be approached and their interest judged by their willingness to render financial assistance.

(3) With sufficient interest manifested, and with the necessary funds in hand, the association shall then proceed, acting on the suggestions of William A. Stone, who shall be employed as chief counsel to prosecute the complaint.

(4) Should the board of trustees adopt these recommendations and order the committee to proceed with the case, the committee recommends and solicits from the association a contribution from the treasury of \$500 as a nucleus to the necessary fund and as an evidence of good faith to co-operating associations.

In addition it is suggested that following the law on the subject of car stakes as enacted and enforced and in practical operation in the state of Florida, an effort be made to secure the passage of similar legislation in as many as possible of other states originating considerable shipments of lumber.

At a meeting of the board of trustees held December 23, 1913, this report was ably presented by F. R. Babcock and adopted by the board as presented.

The appropriation of \$500 requested by the committee, as a nucleus of the fund necessary for the prosecution of a new complaint, has been made by the trustees and is now available for the purpose.

The Florida state law, mentioned in the committee's report, was cited in extenso in our last annual report. It gives, within the state of Florida only, precisely the relief sought for by our former complaint before the Interstate Commerce Commission and is being generally observed by the railroads on intrastate shipments originating at Florida points.

Pending the arrival of the psychological moment none of the affiliated associations have been officially approached, but unofficial discussion leads to the belief that all shippers affected by the former ruling of the commission are chafing under the unjust expense to which shey are subjected, and that the time is ripe for a further attempt to obtain the relief to which we believe we are entitled.

Not only as a matter of justice, but as an economic problem in the line of conservation of our natural resources, this subject is entitled to the fullest consideration.

The secretary then read a telegram from George H. Holt of Chicago, saying that he would be in Buffalo on Thursday to discuss the question of appropriating \$1,000 to act in conjunction with other associations, in the preparation of an experts report and necessary statistics tending to disprove insurance statements and statements made by advocates of substitute materials.

Following the announcement of the banquet in the evening, the meeting adjourned to Thursday.

THURSDAY MORNING SESSION

The Thursday morning session was called to order at 11:15 by H. W. Blanchard. Mr. Blanchard read the report of Chairman M. J. E. Hoban of Brooklyn on coastwise insurance, in the absence of that gentleman. Mr. Hoban's report said that the members of the committee were widely separated and that as nothing of a definite nature has been submitted no meeting had been called. The report said that in the past five years recommendations advocating the formation of mutual insurance in coastwise insurance had been made. He said, however, that conditions are gradually changing in coastwise trade, and tonnage by vessel is yearly growing less; that steamship lines are putting in service at the more important ports

and transportation by cars is increasing. Hence, the report said, the possibilities of any scheme for mutual insurance are lessening each year.

The report said that an experienced actuary in New York City stated that it is not safe to attempt to organize a separate mutual company in this line at present, one of the main difficulties being the inability to control the amount at risk. It said that vessel cargo ranged in value from \$2,000 to \$40,000, and it would be possible in one storm to have several losses.

The report concluded with the statement that before members agree to have the insurance handled by the association, a department might be organized to handle that matter at a considerable saving, as the placing of a large line would undoubtedly be effected at much lower rates. This would result in eventually gathering figures which would prove the advisability or inadvisability of handling it on a mutual basis,

F. R. Babcock of Pittsburgh represented the association at the recent meeting of the Chamber of Commerce of the United States at Washington. He read a detailed report of the results of that meeting. Mr. Babcock said that he had had some difficulty in impressing upon members the necessity of their moral as well as their financial support in connection with the work of the National Chamber of Commerce. He said that care with which the referendums are compiled and the information disseminated and considered by nearly 500 organizations, representing approximately 250,000 individual business men, should make a decided impression upon all business men as to the importance of the organization's work. He said that the result of these efforts is of enormous weight and importance, and that the findings resulting from these referendums are of extreme value as indicating the sentiment of business men of the country. He said in nearly every case the results have indicated a surprising unanimity of opinion among the business interests.

Mr. Babcock then told of the personnel of the administrative officers of the organization, stating that this is a strong argument tending to prove the importance of that body. He said that all questions are handled by speakers who are eminently capable in their respective lines, and that at the recent convention, the keynote was a spirit of fairness to the nation, and in behalf of every interest, whether it be capital or labor, the desire that the law should be fairly interpreted and fairly enforced; that all laws should be fair to capital as well as to labor, and fair to labor as well as to capital.

Mr. Babcock said that it has been demonstrated clearly that because a corporation is large it is not necessarily operating against the public good; and that when any corporation or body of men is trying to monopolize any trade it should be under government control.

Mr. Babcock stated that while much has already been accomplished, a great power of influence is just beginning to make itself felt on the administration of various departments of the government which will greatly influence them in their deliberations. He said that in this way the National Chamber of Commerce has fully justified its existence.

In conclusion, he urged that those who have not already done so assist to the extent of \$25 individual membership, and as much more moral support as could be rendered. He said that some one medium is certainly needed through which the lumbermen can handle their national problems, and that inasmuch as the Chamber of Commerce of the United States offers an entirely legitimate medium for that purpose, and as long as that organization keeps out of politics the lumber industry can safely trust its problems to it.

Mr. Babcock was followed by General Field Secretary Mr. Trefz of the Chamber of Commerce of the United States, who described its organization and method of operation. Mr. Trefz made the somewhat surprising statement that before this body was formed, Turkey and the United States were the only nations which maintained no such organization. He declared that in Germany the remarkable industrial advance which has been made in recent years is due to the assistance rendered by the government as secured through the efforts of the body similar to that now maintained in this country. Mr. Trefz said that complaints and suggestions made by the lumber

trade in connection with legislative matters at Washington have always given the impression to the legislators that these requests and recommendations were actuated by selfish motives, as the appeal had been made by the trade itself or by individuals. He said that by using the medium of the National Chamber of Commerce, such suggestions would bear more weight, and would be considered as coming from an actual need. Mr. Trefz said that of twenty sugestions made regarding national legislation, thirteen had been embodied in whole or in part in the recently enacted currency law.

Secretary J. E. Rhodes of the National Lumber Manufacturers' Association was the next speaker. After stating that he would be glad to do everything possible to advance the general interests of the lumber trade, working in co-operation with the wholesalers' association, he reviewed the various questions which have come before his association during the last couple of years.

Mr. Rhodes concluded with an invitation extended to the wholesalers to attend the annual meeting of the National Lumber Manufacturers' Association, which will be held in Chicago in connection with the Forest Products' Exposition.

George S. Wood, manager of the Forest Products' Exposition, outlined the plans having to do with the expositions in Chicago and New York. He expressed himself as appreciative of the efforts made by trade publications to advance interest in the exposition. He stated that more work had been done by those publications than in connection with any expositions in the history of such efforts.

Secretary Perry read a notice regarding the new workmen's compensation law recently passed by the New York legislature. This law will go into effect July 1, and according to the notice will probably increase liability rates to an amount five times those at present in force. Inasmuch as rates paid by lumber operators and operators in wood are about as high as they can stand, a meeting was called for Friday, March 6, to discuss plans looking to the organization of a lumbermen's mutual casualty insurance company.

F. S. Underhill of Philadelphia opened a discussion of the workmen's compensation law, stating that the time is ripe for intelligent organization of this sort. He moved that a committee of seven be appointed to take care of all matters of this sort.

F. E. Parker of Saginaw, Mich., said that a state compensation law has been in effect in Michigan for about a year, and that lumbermen are pretty well satisfied with the results obtained. He said that among the features working out to a desirable conclusion are limited compensation allowed, payment of compensation direct to the injured party and other features.

J. V. Stimson of Huntingburg, Ind., J. R. Williams of Philadelphia, F. R. Babcock of Pittsburgh and Secretary Perry also spoke on the subject.

After considerable discussion a motion was substituted for that of Mr. Underhill, referring the question to the trustees with the recommendation that they appoint a special committee to handle the problem.

The morning's session then adjourned.

THURSDAY AFTERNOON SESSION

The afternoon session was opened by a report of J. M. Woods, chairman of the committee on forestry. This follows in part:

Report of Committee on Forestry

Probably the most important matter of national legislation affecting the Crest is the Newlands bill, whose author and sponsor is United States Senator Francis G. Newlands of Nevada. It provides an appropriation of \$60,000,000 annually for ten years, or \$600,000,000. It is called by some the conservation pork barrel, but tank steamer would be a more appropriate cognomen. It covers about everything in the heavens above, the earth beneath, and the waters under the earth, and is so adroitly drawn that each section of the country gets a slice, but in some sections the slice is so small it will be hardly noticeable. It is understood the President approves it and Secretaries Lane, Redfield and Houston of the Cabinet have agreed to back it to the limit. Secretary Carrison of the War Department is not so enthusiastic over the project, and the Army Eugineers do not look with favor on the scheme. This is how the appropriation is proposed to be parcelled out.

For the Appalachian and Atlantic region. \$10,000,000
For the drainage basin of the Ohio river. 10,000,000
For the drainage basin of the Mississippi river above St. Louis. 5,000,000

For the Mississippi river from St. Louis to the Gulf of Mexico .	10,000,000
For the drainage of the Missouri river and of the other rivers	10,000,000
For the territory including the dramage basin of the Colorado-	
river	5,000,000
For the drainage basins of the rivers flowing through or into the	

Sacramento and San Joaquin valleys or into the Pacific ocean-5,000,000 For the drainage basins of the Columbia and Snake rivers and other rivers flowing into the Pacific ocean in Oregon and

Washington 5,000,000

Making a total per annum of This is, as can easily be comprehended, a far bigger, a far fatter and a

far juicier piece of pork than that dangled annually in the rivers and harbors appropriation bill, did people but know it and thoroughly under stand it. And if they did but understand it they would throw overboard the old ways of "improving" rivers so quickly and set the reluctant Army Engineers to work on the new system so rapidly that those surprised officials would hardly know on which end they were sitting.

Senator Newlands in the Congressional Record tells the people of the mation what the bill is and what it will accomplish and the forces opposed

to it. This is his own language

A comprehensive, practical and efficient measure is the Newlands bill or the control of the floods of this great valley, and it is growing more ad more in public favor as it is better understood. The makeshifts and ttchwork efforts of less comprehensive measures are falling more and and more in public favour as it is better understood. The makeshifts and patchwork efforts of less comprehensive measures are falling more and more into distavor, particularly when the secret forces opposing the More into distavor, particularly when the secret forces opposing the More into distavor, and the secret forces opposing the More and the delayer of the popular of a repulse fear manner of a country, plus the ratheads, which appear evial and expansion of intand waterways competition, politicians who do not desire the elimination of the politically powerful level boards, power-site speculators who do not desire the federal government to survey and reveal the reservoir and power sites in the source-stream country, those financiers who do not desire the internal development work of the government co-ordinated and made fully efficient, and those national politicians who desire to retain power to choke off escentive initiative, have thrown every possible obstruction in the way of progress in the campaign for the passage of the Newlands river-regulation bill. But their labors are in vain. The Newlands bill is really the river plank of the national platform of the Democratic party translated into legislative form, and it is so designed as to ultimately solve all the great problems incident to the now uncontrolled drainage of the country in such a way as to rehabilitate the navigable waterways and put an end to waste of national platform of the Democratic party translated into legislative form, and it is so designed as to ultimately solve all the great problems incident to the now uncontrolled drainage of the country in such a way as to rehabilitate the navigable waterways and put an end to waste of water, which means a waste of wealth.

Your committee recommend that this association go on record in or position to this bill, that it is adding too heavy financial burdens on the nation.

No estimate has been made of the cost of investigation of the probability of benefits derived. When the Army Engineers do not look favorably on such a scheme there is the best of reasons for waiting. In the present financial and business conditions of the country there should be a pay-asyou-go policy and no new projects undertaken that involve large expendi-At the National Conservation Congress held in Washington the forestry section presented a large number of valuable reports; eleven committees of from five to ten each, submitted valuable facts and data that has been put in book form by the American Forestry Association through E. A. Stirling, 1331 Real Estate building, Philadelphia. society has but little funds and we understand these reports are free to We respectfully recommend that the sum of fifty dollars be donated to help pay for the printing of these reports.

Upon motion of E. V. Babcock, suggestions to appropriate \$50 to aid the American Forestry Association in publishing reports was referred to the new board of trustees for final action.

Secretary Perry read the report of R. C. Lippincott of Philadelphia. chairman of the advisory committee to the American Forestry Association. The report said that that association has been more active and interested in this work during the last year than ever before.

The annual meeting was held in connection with the fifth National Conservation Congress at Washington recently, and was one of the most important of any for several years. Mr. Lippincott's report stated that the reports of the eleven sub-committees which had spent nine months previous to the meeting collecting data and information on special subjects were very able, and had been printed through the efforts of the American Forestry Association. These referred to the possibility of forest planting, state forestry policy, forest taxation, forest investigation, school taxation, utilization of federal

The report paid a high tribute to the work of the American Forestry Association and recommended continued support on the part of the national wholesalers.

J. R. Williams, Jr., of Philadelphia urged individual membership on the part of the members of the National Wholesale Lumber Deal-·ers' Association.

The resolution committee then reported, offering the following resolutions:

Report of Committee on Resolutions

WHEREAS, the Interstate Commerce Commission having given notice of its intention to consider the advisability of the railroads making some charge in addition to freight rates for special services performed on behalf

Whereas, lumber moving in carloads is a very desirable commodity for the railroads to handle, being loaded by the shipper and unloaded by the consignee, thereby relieving the carriers of labor cost and the maintenance of warehouse facilities; and,

WHEREAS, shippers and consignees having sidetracks, having stood the expense of the installation of same; and,

WHEREAS, the use of such private tracks increases the facilities of the railroads by relieving the congestion which would otherwise occur at terminals and public team tracks, and reduces the demurrage charges and railroad per diem charges by more promptly returning the cars to the railread service than can possibly be done where lumber is to be hauled to or

Resolved, That the National Wholesale Lumber Dealers' Association, with a membership of over four hundred wholesale lumber dealers and manufacturers, in convention assembled, petition the Interstate Commerce Commission that no additional charges be granted the railroads for spotting lumber cars on such private tracks until after such private track owners and shippers may be fully heard in defense of the present custom.

WHERFAS, There is now, and for years was been, a large net profit on first-class mail, and whereas such profits have been entirely dissipated by the losses incurred in handling other classes of mail at less than cost of service, thus working an injustice on all users of first class postage, therefore be it.

RESOLVED. That a one cent rate for ordinary letters should be accorded. at once, to all users of the letter mail, and we, therefore, ask members of Congress to support Senate Bill No. 152, introduced in the United States Senate by Hon, Theodore E. Burton, and House Bill No. 4322, introduced in the House of Representatives by Hon, Charles L. Bartless for one-cent letter postage measures, and to use their efforts to secure the passage of these bills with as little delay as possible.

The secretary of this body is hereby instructed to send copies of this resolution to our senators and representatives, and also to do everything within his power, by correspondence, publicity, etc., to accomplish the results which the National One-Cent Letter Postage Association is endeavoring to secure.

WHEREAS, there will be held in the Coliseum of Chicago, Ill., from April 30 to May 9, and in the Grand Central Palace of New York, from May 21 to 30, inclusive, the Forest Products Exposition which is being promoted by co-operative effort for the exhibition of forest products of all kinds, and

WHEREAS, the Forest Products Exposition will be held for the purpose of showing the public the magnitude, importance and influence of lumber industry, in all of its branches, as well as for the purpose of advertising the merits of wood as a building material and all other purposes for which it is suitable, and

WHEREAS, the Forest Products Exposition will have a great popular educational value that will be of direct benefit to the manufacturers and producers of forest products of all kinds, be it therefore

RESOLVED, that this association, in annual meeting assembled, heartily approves of the objects of the Forest Products Exposition, and that we urge our members and all others interested in the welfare of the lumber and allied industries, to support the exposition by active participation therein, and by attending the same personally, and urging their associates

Death has removed during the year three of the founders and early officers of this association, Alfred C. Tuxbury, William A. Crombie and William B. Millard. These men gave freely of their time and service in the interests of organized lumber trade. They were bonored by all, and their passing is noted here with sorrow and a keen sense of our loss.

RESOLVED, that the president and secretary of the association convey to the members of the families of the deceased this minute, and express to them our deep sympathy.

WHEREAS, it appears to this association that inexact and unreliable statistics regarding insurance and substitute material for lumber are being compiled and published to the hurt of the lumber trade, therefore be it

RESOLVED, that this matter be referred to the trustees with power to act alone or along with other associations with a view of placing both properly before the public.

WHEREAS, the railroads are asking of the Interstate Commerce Commission an increase of five per cent in freight rates and claiming urgently the need of same : and.

WHEREAS, the members of this association are interested in a large way in the right and prompt adjustment of this claim; therefore be it

RESOLVED, that we join in asking the commission to render at as early a date as possible its decision in the matter in the interest of the railroads, the lumber shippers and the commerce of the country in general.

WHEREAS, the tendency of the general property tax in its application to timberlands is inequitable in its results because it forces rapid wasteful cutting and threatens confiscation; and,

WHEREAS, a yield tax on timber is equitable to all, is definite and easily administered and correct in principle because the tax is taken when the income is realized, therefore be it

Reserved that this association endorses the principle of a yield fax on timber and urges it as the correct policy toward timberlands in all states having forest interests.

RESOLVED, that the members tender to President Walcott and his assoclate executive officers appreciation of the faithful services and efficient handling of the association interests during the present year.

RESOLVED, that we appreciate the very kind invitation extended to have us come to Buffalo, and desire to thank the Buffalo & Tonawanda Lumber Association for their care and oversight of our members while visiting Buffalo.

RESOLVED, that we desire to express to the Iroquois Hotel Company our appreciation of its very generous treatment during this meeting which has added materially to the success and pleasure of our convention,

Following the report of the committee, there was a heated discussion again regarding the proposed five per cent increase. The résolution on this subject simply urged prompt and rightful decision in the matter on the part of the Interstate Commerce Commission, in the interest of railroads, lumber shipments and general commerce of the country. Some expressed themselves as believing that the resolution should be couched in more forceful language. It was suggested that a substitute resolution be offered asking for immediate decision in favor of the proposed increase. This was strongly objected to by others. Finally the convention adopted the resolution as offered by a majority vote.

E. V. Babcock of Pittsburgh, chairman of the nominating committee, presented the following names as trustees for three years and they were duly elected:

W. W. Knight, Indianapolis: Alexander Willson, Pittsburgh; C. F. Treadway, New Haven, Conn.; A. L. Stone, Cleveland, O.; C. H. Hershey, Newark, N. J.; M. E. Preisch, North Tonawanda, N. Y., and B. F. Betts, Philadelphia.

F. R. Babcock of Pittsburgh then opened the nominations for officers, and speaking in glowing terms of the unusual loyalty, ability, excellent judgment and generally high character of Gordon C. Edwards of Ottawa, Ont., presented his name for nomination for president for the ensuing year.

The nomination was seconded by C. H. Prescott of Cleveland, O. Mr. Prescott in seconding Mr. Babcock's nomination stated that Mr. Edwards had never missed a meeting of the board of trustees or the executive committee. The election of Mr. Edwards was unanimously recommended by the association.

Thus, for the first time in its history, the association has a president whose residence is without the boundaries of the country. His choice is unquestionably an unusually popular one, as he enjoys the full confidence, entire respect and the deep affection of all of the members.

Mr. Walcott appointed F. R. Babcock and C. H. Prescott as a committee to escort Mr. Edwards into the convention hall. He was brought in in a rather unusual manner, on the shoulders of the reception committee, and was greeted with tremendous applause from the members.

Mr. Edwards expressed himself in a fitting way as appreciative of the honor, and also stated that he was confident that the Canadian trade would be fully appreciative. In his talk Mr. Edwards was solicitous of the co-operation of the membership and also dwelt upon the importance of building up that feature of the association.

M. E. Preisch of the local entertainment committee then spoke a final word of appreciation for the convention, after which the session adjourned.

The trustees met following the adjournment and the following officers were elected:

RESIDENT—Gordon C. Edwards, Ottawa, Ont. FIRST VICE-PERSIDENT—W. W. Knight, Indianapolis, Ind. SECOND VICE-PERSIDENT—A. L. Stone, Cleveland, O. SECENTARY—E. F. Perry, New York, N. Y. TERSAUERE—Henry Cape, New York, N. Y.

THE ENTERTAINMENT

The annual banquet held in the Iroquois hotel on Thursday evening, at which both the men and attending ladies were present, was an unusually brilliant affair and 300 members, guests and ladies were

Retiring President Walcott delivered a final message to the association on this occasion. He outlined the excellent results obtained through the association efforts in the past years, and predicted that the future of the association could be nothing else than brilliant.

Mr. Walcott introduced Gordon C. Edwards, the newly elected

president. Mr. Edwards responded with a brief acknowledgment of the honor of the election.

John Archdeacon Murphy of Buffalo was introduced as toastmaster. Those who responded to toasts were: Hon, John V. Sisson, congressman from the fourth Mississippi district; Hon. Rodolphe LeMieux, former postmaster-general of Canada; Edward F. Trefz of Chicago, field secretary of the Chamber of Commerce of the United States.

On Wednesday night a well arranged and unusually successful smoker was given for the benefit of the men, while a musical program and reception were provided for the ladies, in the parlor of the hotel. In both cases suitable light refreshments were served.

Hugh McLean, prominent in Buffalo lumber circles, tendered a luncheon at the Buffalo club at one o'clock on Thursday, at which the Hon. Rodolphe LeMieux, former postmaster-general of Canada, was the guest of honor.

The entertainment committee in charge of the local arrangements was composed of: M. E. Preisch, M. M. Wall, John McLeod, C. W. Betts, Henry J. George, Isaac N. Stewart and Arthur W. Kreinheder of Buffalo, and James L. Crane and R. T. Jones of Tonawanda.

Action on Through Bills as Affecting Demurrage

Much interest is manifested among lumber exporters here in the report of the House Committee on Merchant Marine and Fisheries, which has just been submitted to the House and which recommends legislation bringing water carriers that do an interstate business and foreign steamship lines entering American ports under the supervision of the Interstate Commerce Commission. The committee engaged in an extended investigation of steamship combinations, and the report is at least in part based upon the facts learned in the course of this investigation. The proposed legislation would give the Interstate Commerce Commission the same complete authority over the American domestic steamship companies, with the power to regulate rates and determine maximum freight and passenger charges, as it now exercises over gailroads. It is further proposed that the foreign steamship lines be required to file their agreements and understandings with other companies; that the commission be empowered to make investigations into unreasonable rates; to inquire into unfair practices, with authority to compel their discontinuance, and to prohibit the use of fighting ships and deferred debates. The investigation made has shown to what a large extent agreements to divide traffic and to apportion returns as well as to fix rates arbitrarily are entered into by the foreign steamship lines, competition being practically eliminated. The matter of special interest to exporters, however, is the refusal of the steamship lines to accept through bills of lading unless the lines are exempt from liability for demurrage on cars and because of other conditions which are burdensome to the shippers. Under existing circumstances the exporters are entirely at the mercy of the steamship lines, which delay taking lumber and logs intended for export as long as suits their convenience, and frequently keep loaded cars at terminals for week and even months. The railroads felt impelled to fix time limits and insist upon demurrage, which the exporters refused to pay because the delay was not any fault of theirs. The steamship lines avoided responsibility by the simple expedient of refusing to recognize through bills of lading. It was this state of affairs which prompted the exporters to complain to the Interstate Commerce Commission about the railroads. A date for a hearing last year was set, but afterward postponed, it being clearly recognized that the railroads were not at fault. Later a bill was offered in the House which requires the railroad companies to issue and the steamship lines to recognize through bills of lading; but here againthe difficulty was in a lack of authority with the Interstate Commerce Commission over the foreign steamship lines. The recommendations of the Committee on Merchant Marine and Fisheries is designed to meet this lack of authority. It is felt by the exporters that when foreign steamship lines require the former to enter into contracts for the shipment of lumber and logs, the carriers should be held to furnish adequate facilities and that there should be some power to restrain them from enforcing onerous and inequitable requiremenlts.

Oak in the Planing Mill

Differences of opinion make many other things than horse races. For example they may make for or against the use of certain kinds of lumber for a given work. Opinions, not backed up by supporting facts to justify, have been responsible for a share of substitutes for wood in ear building, in millwork, in furniture and in many other lines. Most of these opinions originate outside the lumber fraternity itself, but now we have before us a case where opinions within the lumber fraternity may offer some handicap, for instance in the use of oak in the planing mill.

At a recent meeting of the Ohio Retail Lumber Dealers' Association there was an interesting blackboard talk by the newly elected president, S. S. King, of Dayton, Ohio, in which he presented the results of two calculations of cost in millwork, one of working yellow pine and the other of working plain oak.

These two calculations were as follows:

,	1.	L	, 11	: 1	11:	\1 .										
Cost, 1,000 feet																836.5
Handling																
Ripping and cutting																
Cross-cutting																
Loss in ripping and cutting																
Sticker work																
Sanding																
Burdling																
Overhead, including deliver																5.4
Total																862.0
	P	.AT	N	()	Δi											
Cost, 1,000 feet											 				8	60,0
Handling oplacing on stick	S I															2.5
Ripping and dressing													 			5.0
Cross-cutting														i		2.0
Loss in ripping and cutting																20.0
Sticking																3.1
Sanding																4.0
Bundling																1.0
Overhead																
Kiln drying and loss throug																
min drying and joss turoug	11	ur,	y 1	118		٠.	٠		• •		 ٠	 	 	٠		3.0

Taking the items of the original lumber cost from the totals in these calculations we have a cost of \$25.52 for working pine and a cost of \$54.65 for working oak. This makes the cost of millwork in oak figure more than double the cost in pine. If this is not a fair estimate and the cost applied to oak is disproportionate it indicates an unfair handicap against oak in planing mill work. That is why those interested in oak should study and analyze these figures and set themselves about correcting any errors that may appear in the comparison.

Taking the first item in the list, we find a charge of \$1.50 for handling pine, whereas the charge for handling oak and placing it on sticks is \$2.50. Then we have ripping and dressing and cutting made into two items and totaling \$7 per thousand for oak, whereas the ripping and cross-cutting of pine shows a total of only \$4. The presumption here is that pine is received already dressed, which is true in some instances. In many other instances, however, pine for planing mill work is purchased rough, consequently there would be a dressing charge. The next item to note is that the loss in ripping and cutting on the pine is figured at \$4.20 while the loss in ripping and cutting on oak is figured at \$20. That is a difference that looks too wide or else the original cost of the oak is figured too high. A waste of this kind would indicate a low-grade oak, whereas the figures

of cost suggest oak of a good quality which should not waste a great deal more than pune of the same quality.

The next two items on the list show favor to oak and they are the only two which do. The sticker work and the sanding both show cheaper on the oak than on the pine. The overhead charges on the oak is given at \$9.00, whereas the overhead charges, including delivery, on pine is given at \$5.47. Evidently this overhead is figured on a percentage basis charging in relation to the total charge for work, which of itself offers room for a difference of opinion.

The final item in the list of oak cost, that of \$5.00 for kiln drying and loss through drying, is deserving of some special attention. There is no charge whatever for kiln drying pine. This charge is evidently omitted on the theory that the pine is kiln-dried at the sawmill before shipping and the drying cost is included in the original selling price. Sometimes oak may be kiln dried at the mill, too. That, however, is not the important point for consideration in this instance. The important point is found in the fact that the oak is given a thorough kiln-drying before it is used in the planing mill or at least the kiln-drying should be thorough with this charge against it. This puts it in much better shape for cabinet work and for interior trim than one usually finds pine. The millmen manufacturing and shipping yellow pine go through the motions of kiln-drying and some of them do the work more thoroughly than others, yet it is seldom indeed that one receives what is called kiln-dried yellow pine lumber that can be depended upon for doing first class joinery. As a manufacturer of oak flooring puts it, when the pine folks are through kiln-drying they are just at the point where the oak man is beginning his serious work of thorough drying, which means that to qualify pine for comparison with oak in millwork or any other high grade joinery it should be thoroughly kiln-dried at the planing mill and have substantially the same charge for this work put against it as is given for oak.

There is no question of the carnest intent of the men who presented these figures and discussed them, but there is room for questioning their fairness to oak. Those taking part in this discussion were not thinking anything about the welfare of oak as compared with pine, but were earnestly concerned with impressing upon all present the idea that costs often mount higher than they are figured up at. That at least has been the purpose of most association cost figures and demonstrations—to stimulate higher charges for cost items to the end that better prices will be asked for the finished product. It is a commendable idea and the lessons were undoubtedly needed, but there should be a way to get the lessons without being unfair to oak or any other kind of wood.
